1 The Cauchy Integral

1.1 Preliminaries

Notation 1.1. Let $\underline{z} \in \mathbb{C}^n$, we define the max norm and the Euclidean norm as

$$|\underline{z}| = \max_{i \leq j \leq n} |z_j|,$$
$$\|\underline{z}\| = \sqrt{\sum_{j=1}^n |z_j|^2},$$

respectively.

Definition 1.1. Let $\underline{a} \in \mathbb{C}^n$ and $\underline{r} \in (0, \infty)^n$. We define a poly disk around \underline{a} to be

$$D_{\underline{r}}(\underline{a}) = \{\underline{z} \in \mathbb{C}^n \mid \forall 1 \leq j \leq n, |z_j - a_j| < r_j\}.$$

We also define for $r \in (0, \infty)$,

$$D_r(\underline{a}) = \{\underline{z} \in \mathbb{C}^n \mid \forall 1 \leq j \leq n, |z_j - a_j| < r\}.$$

In particular, when $r = 1$ and $\underline{a} = \underline{o}$, we define the unit polydisk

$$\mathbb{D} = D_1(\underline{o}).$$

Definition 1.2. Let $\underline{a} \in \mathbb{C}^n$ and $\underline{r} \in (0, \infty)^n$. We define a poly disk around \underline{a} to be

$$D_r(\underline{a}) = \{\underline{z} \in \mathbb{C}^n \mid \forall 1 \leq j \leq n, |z_j - a_j| < r_j\}.$$

We also define for $r \in (0, \infty)$,

$$D_r(\underline{a}) = \{\underline{z} \in \mathbb{C}^n \mid \forall 1 \leq j \leq n, |z_j - a_j| < r\}.$$

In particular, when $r = 1$ and $\underline{a} = \underline{o}$, we define the unit polydisk

$$\mathbb{D} = D_1(\underline{o}).$$

Definition 1.3. *The unit ball around the origin is*

$$\mathbb{B} = \{\underline{z} \in \mathbb{C}^n \mid \|\underline{z}\| < 1\}.$$

Remark 1.1. *Observe that \mathbb{C}^n is $2n$ -dimensional \mathbb{R} -vector space. Therefore, we have*

$$\partial\mathbb{B} \cong S^{2n-1}.$$

Remark 1.2. *While $\partial\mathbb{B}$ is smooth, $\partial\mathbb{D}$ is not.*

Definition 1.4. *The n -dimensional torus is*

$$\partial_0\mathbb{D} := \{\underline{z} \in \mathbb{C}^n \mid \forall 1 \leq j \leq n, |z_j| = 1\}.$$

Indeed we see

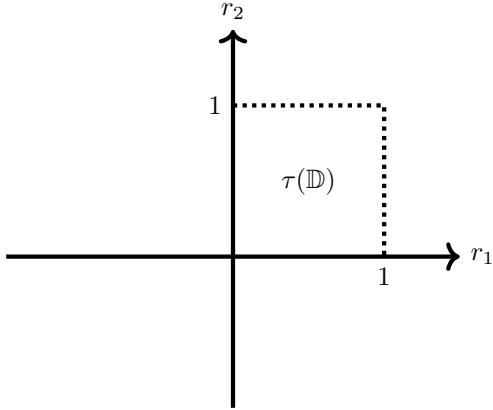

$$\partial_0\mathbb{D} = (S^1)^n.$$

Proposition 1.1. *Let $\tau : \mathbb{C}^n \rightarrow (0, \infty)^n$ be such that*

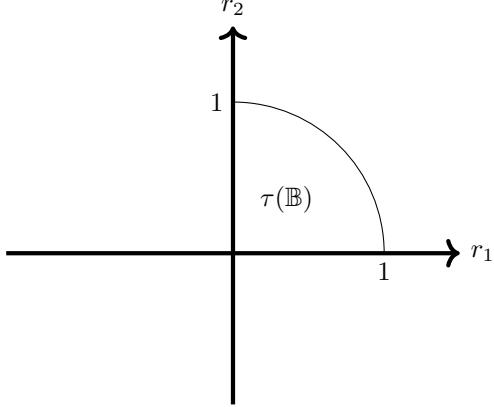

$$\tau(z_1, \dots, z_n) = (|z_1|, \dots, |z_n|).$$

Furthermore, let $\underline{r} \in [0, \infty)^n$ be such that k -many coordinates are non-zero. Then $\tau^{-1}(\underline{r})$ is a k -dimensional torus.

Example 1.1. *For $n = 2$, we have*

and

Definition 1.5. Let $M \subseteq \mathbb{C}^n$. A function $F : M \rightarrow \mathbb{C}^m$ is continuous if for $F = (f_1, \dots, f_m)$, where for each $1 \leq i \leq m$, $f_i : M \rightarrow \mathbb{C}$, f_i is continuous.

Definition 1.6. $f : U \rightarrow \mathbb{C}$ is differentiable at $\underline{z}_0 \in U$ if there exists $\Delta_i, E_i : U \rightarrow \mathbb{C}$, ($1 \leq i \leq n$) such that they are continuous at \underline{z}_0 and

$$f(\underline{z}) - f(\underline{z}_0) = \sum_{i=1}^n (z_i - z_{0,i})\Delta_i(\underline{z}) + \sum_{i=1}^n (\overline{z_i} - \overline{z_{0,i}})E_i(\underline{z}).$$

Δ_i, E_i are called Wirtinger derivatives. They are usually denoted as

$$\Delta_i(\underline{z}_0) = \frac{\partial f}{\partial z_i}(\underline{z}_0), \quad E_i(\underline{z}_0) = \frac{\partial f}{\partial \overline{z_i}}(\underline{z}_0).$$

Proposition 1.2. Let $f : U \rightarrow \mathbb{C}$ be differentiable. Then we have

$$\begin{aligned} \frac{\partial f}{\partial z_i} &= \frac{1}{2} \left(\frac{\partial f}{\partial x_i} - i \frac{\partial f}{\partial y_i} \right), \\ \frac{\partial f}{\partial \overline{z_i}} &= \frac{1}{2} \left(\frac{\partial f}{\partial x_i} + i \frac{\partial f}{\partial y_i} \right). \end{aligned}$$

Corollary 1.1.

$$\begin{aligned} \frac{\partial z_i}{\partial z_j} &= \delta_{ij}, \quad \frac{\partial z_i}{\partial \overline{z_j}} = 0, \\ \frac{\partial \overline{z_i}}{\partial z_j} &= 0, \quad \frac{\partial \overline{z_i}}{\partial \overline{z_j}} = \delta_{ij}. \end{aligned}$$

In particular,

$$\overline{\left(\frac{\partial f}{\partial z_i} \right)} = \frac{\partial \overline{f}}{\partial \overline{z_i}}.$$

Definition 1.7. Let $U \subseteq \mathbb{C}^n$. A function $F : U \rightarrow \mathbb{C}^m$ is differentiable if for $F = (f_1, \dots, f_m)$, where for each $1 \leq i \leq m$, $f_i : M \rightarrow \mathbb{C}$, f_i is differentiable.

Proposition 1.3. Let $U \subseteq \mathbb{C}^n$ be open. A function $f : U \rightarrow \mathbb{C}$ with $f = g + ih$ for some $g, h : U \rightarrow \mathbb{R}$ is differentiable if g, h are differentiable.

Proposition 1.4 (Chain Rule). Let $U \subseteq \mathbb{C}^n$, $V \subseteq \mathbb{C}^m$ be open sets and consider differentiable functions $F : U \rightarrow V$ and $f : V \rightarrow \mathbb{C}$ where $F = (f_1, \dots, f_m)$. We have

$$\frac{\partial(f \circ F)}{\partial z_i}(\underline{z}) = \sum_{j=1}^m \frac{\partial f}{\partial w_j}(F(\underline{z})) \frac{\partial f_j}{\partial z_i}(\underline{z}) + \sum_{j=1}^m \frac{\partial f}{\partial \bar{w}_j}(F(\underline{z})) \frac{\partial \bar{f}_j}{\partial z_i}(\underline{z}).$$

1.2 Holomorphic Functions

Definition 1.8. Let $U \subseteq \mathbb{C}^n$ be open and $f : U \rightarrow \mathbb{C}$ be a function. f is complex differentiable at $\underline{z}_0 \in U$ if there exists functions $\Delta_1, \dots, \Delta_n : U \rightarrow \mathbb{C}$ which are continuous at \underline{z}_0 with

$$f(\underline{z}) - f(\underline{z}_0) = \sum_{i=1}^n (z_i - z_{0,i}) \Delta_i(z).$$

f is holomorphic at \underline{z}_0 if it is complex differentiable in a neighborhood of \underline{z}_0 . The values

$$\Delta_i(\underline{z}) = \frac{\partial f}{\partial z_i}(\underline{z}_0)$$

are called the complex partial derivatives.

Remark 1.3. f is holomorphic at \underline{z}_0 if and only if it is differentiable at \underline{z}_0 with $E_i \equiv 0$ for all $1 \leq i \leq n$.

Example 1.2. z_i are holomorphic but \bar{z}_i are not. Polynomials in z_1, \dots, z_n are holomorphic.

Definition 1.9. A function $F : U \rightarrow \mathbb{C}^m$ given by $F = (f_1, \dots, f_m)$ is holomorphic if all f_i are holomorphic.

Proposition 1.5. $F : U \rightarrow \mathbb{C}^m$ is holomorphic if and only if for any open subset $V \subset \text{Im } F$ and a holomorphic function $f : V \rightarrow \mathbb{C}$, $f \circ F$ is holomorphic.

Theorem 1.1. $f : U \rightarrow \mathbb{C}$ is holomorphic if and only if f is real-differentiable (ie. with respect to x_i and y_i for $z_i = x_i + iy_i$), and for all $1 \leq i \leq n$, $\frac{\partial f}{\partial \bar{z}_i} = 0$.

Remark 1.4. $f : U \rightarrow \mathbb{C}$ is holomorphic if and only if for each $1 \leq i \leq n$ and fixed z_1, \dots, z_n , $z_i \mapsto f(z_1, \dots, z_n)$ is holomorphic.

Definition 1.10. A complex line is a function $l : \mathbb{C} \rightarrow \mathbb{C}^n$ such that there exists $\underline{a}, \underline{w} \in \mathbb{C}^n$, $w \neq \underline{o}$, such that

$$l(t) = \underline{a} + t\underline{w}.$$

The image of l is denoted by $l(\mathbb{C}) = L$.

Notation 1.2. For a function $f : U \rightarrow \mathbb{C}$, we denote

$$f|_L(t) := f \circ l(t) = f(\underline{a} + t\underline{w}).$$

Remark 1.5. Using the chain rule, we see

$$\frac{d}{dt} f|_L(t) = \sum_{i=1}^n \frac{\partial f}{\partial z_i}(\underline{a} + t\underline{w}) w_i.$$

1.3 Cauchy Integrals

We will consider a holomorphic function $f : U \rightarrow \mathbb{C}$ where U is a neighborhood of the closure of $D = D_r(\underline{a})$. Without the loss of generality we assume $\underline{a} = \underline{o}$. Let $\underline{z} \in D$, applying the Cauchy integral to the first variable, we see that

$$f(z_1, \dots, z_n) = \frac{1}{2\pi i} \int_{|\zeta_1|=r_1} \frac{f(\zeta_1, z_2, \dots, z_n)}{\zeta_1 - z_1} d\zeta_1.$$

Repeating this process, we get

$$f(z_1, \dots, z_n) = \left(\frac{1}{2\pi i} \right)^n \int_{|\zeta_n|=r_n} \dots \int_{|\zeta_1|=r_1} \frac{f(\zeta_1, \dots, \zeta_n)}{\prod_{i=1}^n (\zeta_i - z_i)} d\zeta_1 \dots d\zeta_n.$$

This is valid on the disk D . Motivated by the above equation, we have,

Definition 1.11. The Cauchy kernel in \mathbb{C}^n is

$$C(\underline{\zeta}, \underline{z}) = \left(\frac{1}{2\pi i} \right)^n \frac{d\zeta_1 \wedge \dots \wedge d\zeta_n}{(\zeta_1 - z_1) \dots (\zeta_n - z_n)}.$$

Theorem 1.2. Let $f : \overline{D} \rightarrow \mathbb{C}$ be a holomorphic function and $z \in D$, we have

$$f(z) = \int_T f(\underline{\zeta}) C(\underline{\zeta}, \underline{z}),$$

where $T = \partial_0 D$, the distinguished boundary of the poly disk D .

Proposition 1.6. Suppose h is a continuous function on $T = \partial_0 D$ for some disk D , then the function

$$F(z) = \int_T h(\underline{\zeta}) C(\underline{\zeta}, z),$$

is holomorphic on D

Remark 1.6. The theorem tells us that a holomorphic function f on a disk D is completely determined by its values on $T = \partial_0 D$.

Remark 1.7. The theorem also holds if the function f is continuous on \overline{D} and holomorphic on D .

This theorem tells us moreover all the local properties about the holomorphic functions. The strategies are to work on the one dimensional cases or restrict functions to complex lines. All the proofs are listed in [Fi/Li, II section 1] of A Course in Complex Analysis.

Theorem 1.3. *f is holomorphic on an open set U that is smooth. Then all the derivatives are again holomorphic.*

sketch. Since an open set contains a disk, we can use the Cauchy integral on that disk. Since holomorphicness is a local property, we obtain the statement. \square

Remark 1.8. *If f is as in Theorem 1.2, then for $\underline{\alpha} \in \mathbb{N}_0^n$,*

$$D^{\underline{\alpha}} f(\underline{z}) = \frac{\alpha_1! \cdots \alpha_n!}{(2\pi i)^n} \int_T \frac{f(\underline{z})}{(\zeta_1 - z_1)^{\alpha_1+1} \cdots (\zeta_n - z_n)^{\alpha_n+1}} d\zeta_1 \cdots d\zeta_n.$$

We will denote the above formula as,

$$D^{\underline{\alpha}} f(\underline{z}) = \frac{\underline{\alpha}!}{(2\pi i)^n} \int_T \frac{f(\underline{z})}{(\underline{\zeta} - \underline{z})^{\underline{\alpha}+n}} d\underline{\zeta}.$$

Theorem 1.4 (Weierstrass). *Let $(f_n)_{n \in \mathbb{N}}$ be a sequence of holomorphic functions uniformly converging to f. Then f is holomorphic and all derivatives of f_i are also uniformly converging to the ones of f.*

Definition 1.12. *A domain is an open connected subset of \mathbb{C}^n .*

Theorem 1.5 (Maximal Principle). *Let f be holomorphic on the domain U. If $|f|$ attains a local maximal then $f \equiv c$ to some constant $c \in \mathbb{C}$.*

Theorem 1.6. *Suppose f is holomorphic on a closure \overline{D} of some polydisk $D = D_r(\underline{z}_0)$. For $\underline{z} \in D$,*

$$\left(\frac{1}{2\pi i} \right) \int \cdots \int_T \frac{f(\underline{z})}{(\underline{\zeta} - \underline{z})^{\underline{\alpha}}} d\underline{\zeta}.$$

We develop this into a geometric series, and interchange the summation, we get

$$f(\underline{z}) = \sum_{\alpha \in \mathbb{N}_0^n} a_{\underline{\alpha}} (\underline{z} - \underline{z}_0)^{\underline{\alpha}}$$

where for each $\underline{\alpha} \in \mathbb{N}_0^n$,

$$a_{\underline{\alpha}} = \frac{D^{\underline{\alpha}} f(\underline{z}_0)}{\underline{\alpha}!}.$$

The series is moreover uniformly convergent on D.

Theorem 1.7. *Let f be holomorphic on a domain U. Then for each $\underline{z}_0 \in U$, there exists a convergent series*

$$f(\underline{z}) = \sum a_{\underline{\alpha}} (\underline{z} - \underline{z}_0)^{\underline{\alpha}}$$

where for each $\underline{\alpha} \in \mathbb{N}_0^n$,

$$a_{\underline{\alpha}} = \frac{D^{\underline{\alpha} f(z_0)}}{\underline{\alpha}!}.$$

Series converges at least in the largest polydisk about $D_r(\underline{z}_0) \subset U$ (the boundary is contained in U).

Theorem 1.8. *Holomorphic functions are analytic, in other words, locally developable into a power series.*

Theorem 1.9 (Identity Theorem). *If f is holomorphic on a domain U , and if f is identically 0 in a non-empty open neighborhood V in U , then f is identically 0 on U .*

Theorem 1.10. *Let f be a continuous and holomorphic in each variable separately. Then f is holomorphic.*

Proof. Can be shown using Cauchy's integral formula. \square

Definition 1.13. *Let \mathcal{G} be a domain. We define $\mathcal{O}(\mathcal{G})$ to be the set of all holomorphic functions on U .*

Proposition 1.7. *$\mathcal{O}(\mathcal{G})$ is a \mathbb{C} -algebra. Furthermore, the following properties hold,*

- 1). $\mathcal{O}(\mathcal{G})$ has no zero divisors. (Follows from Identity theorem).
- 2). We can in

Proposition 1.8. *$\mathcal{O}(\mathcal{G})$ can be introduced a topology by the following way. Given a compact subset $K \subset \mathcal{G}$, we define*

$$V(K, \varepsilon) = \{f \in \mathcal{O}(\mathcal{G}) \mid |f|_K < \varepsilon\}$$

where

$$|f|_K = \max_{\underline{z} \in K} |f(\underline{z})|.$$

Such $V(K, \varepsilon)$ form a neighborhood basis for $0 \in \mathcal{O}(\mathcal{G})$.

We observe that $\mathcal{O}(\mathcal{G})$ is a Fréchet algebra, (ie. convergence automatically means locally uniform convergence) and

$$\frac{\partial}{\partial z_i} : \mathcal{O}(\mathcal{G}) \rightarrow \mathcal{O}(\mathcal{G})$$

are continuous linear maps.

Theorem 1.11 (Liouville). *Let f be a bounded holomorphic function on \mathbb{C}^n . Then it is identically constant.*

Theorem 1.12 (Hartogs). *Let f be a function which is holomorphic in each variable separately then f is holomorphic.*

Proof. See [Hörmander 2.2.8] □

Theorem 1.13 (Hartogs's Kugelsatz). *Suppose $n > 0$. Let $K \subset U$ be a compact subset of an open set such that $U \setminus K$ is connected. If f is holomorphic on $U \setminus K$, then f extends holomorphically to the whole U .*

Proof. Will be shown later. □

Remark 1.9. *Using the theorem above, we conclude that there are no isolated singularities and isolated 0s. (ie. a holomorphic function on a punctured domain can be extended to that point). The latter follows that if $f(z) = 0$, then $\frac{1}{f}(z)$ has an isolated singularity.*

Proposition 1.9. *Let $f \not\equiv 0$ be a holomorphic function on a domain \mathcal{G} . We have*

$$V(f) = \{z \in \mathcal{G} \mid f(z) = 0\}$$

has no interior points and has Lebesgue measure 0.

1.4 Holomorphic Maps and Differential Forms

Recommended literature : Range Holomorphic functions and integral representation for several complex variables.

Definition 1.14. *Let $F : \mathbb{C}^n \supset U \rightarrow V \subset \mathbb{C}^m$ be a function given by $F = (f_1, \dots, f_m)$ is holomorphic if f_i is holomorphic for each i . Or equivalently for any $f \in \mathcal{O}(V)$, the pullback $f \circ F$ is holomorphic on U .*

Corollary 1.2. *Given $U \xrightarrow{F} V \xrightarrow{G} W$ holomorphic functions, the composition $G \circ F$ is holomorphic. Obviously $\text{id} : U \rightarrow U$ is holomorphic.*

Definition 1.15. *Let $U, V \subseteq \mathbb{C}^n$ be open and $F : U \rightarrow V$ be differentiable given by $F = (f_1, \dots, f_n)$ such that for each f_i , it decomposes into*

$$f_i = g_i + i h_i.$$

We define the real Jacobian by

$$J_F^{\mathbb{R}} = \begin{pmatrix} \frac{\partial g_i}{\partial x_j} & \frac{\partial h_i}{\partial x_j} \\ \frac{\partial g_i}{\partial y_j} & \frac{\partial h_i}{\partial y_j} \end{pmatrix}_{1 \leq i, j \leq n} \in \mathbb{R}^{2n \times 2n},$$

and the complex Jacobian by

$$J_F^{\mathbb{C}} = \begin{pmatrix} \frac{\partial f_i}{\partial z_j} & \frac{\partial \bar{f}_i}{\partial \bar{z}_j} \\ \frac{\partial f_i}{\partial \bar{z}_j} & \frac{\partial \bar{f}_i}{\partial z_j} \end{pmatrix}_{1 \leq i, j \leq n} \in \mathbb{C}^{2n \times 2n}.$$

Furthermore, if f is holomorphic we have the holomorphic Jacobian

$$J_F^h = \left(\frac{\partial f_i}{\partial z_j} \right)_{1 \leq i, j \leq n} \in \mathbb{C}^{n \times n}.$$

Proposition 1.10. *We have the following formulas.*

$$\operatorname{rk} J_F^{\mathbb{R}} = \operatorname{rk} J_F^{\mathbb{C}}, \quad \det J_F^{\mathbb{R}} = \det J_F^{\mathbb{C}}.$$

In particular $\det J_F^{\mathbb{C}}$ is a real number. Furthermore, if F is holomorphic,

$$J_F^{\mathbb{C}} = \begin{pmatrix} J_F^h & O \\ O & \overline{J_F^h} \end{pmatrix}$$

In particular

$$\det J_F^{\mathbb{C}} = |\det J_F^h|^2 \geq 0.$$

Proof. exercise. □

Definition 1.16. *A function $F : U \rightarrow V$ is biholomorphic if it is bijective and F^{-1} is also holomorphic.*

Proposition 1.11. *Let F be a biholomorphic function, then we have*

$$\det J_F^{\mathbb{C}} > 0.$$

Corollary 1.3. *Biholomorphic functions preserve orientation.*

Recall that if $f : U \rightarrow \mathbb{C}$ where $U \subset \mathbb{C}$ is a holomorphic and injective function. Then necessary we have $f'(z) \neq 0$.

Proposition 1.12. *Let $F : U \rightarrow V$ be a holomorphic bijective such that J_F^h is everywhere regular (ie. its determinant is nowhere 0). Then f is biholomorphic.*

Proof. We know that F^{-1} is differentiable. We get

$$J_F^{\mathbb{C}} \circ J_{F^{-1}}^{\mathbb{C}} = I_{2n}.$$

By the assumption, we have,

$$J_F^{\mathbb{C}} = \begin{pmatrix} M & O \\ O & \overline{M} \end{pmatrix}.$$

Thus we rewrite the first equation to be

$$\begin{pmatrix} M & O \\ O & \overline{M} \end{pmatrix} \begin{pmatrix} A & B \\ C & D \end{pmatrix} = \begin{pmatrix} I_n & O \\ O & I_n \end{pmatrix}$$

We have

$$MA = E, MB = 0.$$

Thus we concluder $A = M^{-1}, B = O$. We get a Cauchy-Riemann equations. □

Theorem 1.14 (Osgood's Theorem). *Suppose $F : U \rightarrow V$ be bijective holomorphic function where $U, V \subset \mathbb{C}^n$. Then J_F^h is everywhere regular and F is therefore biholomorphic.*

Proof. Range's book I chapter 2.5. □

1.5 Differential Forms

Definition 1.17. Let $\underline{x}_0 \in \mathbb{R}^N$. We set

$$\mathcal{S}(\underline{x}_0) = \{f : U_f \rightarrow \mathbb{R} \mid \text{continuous function defined on some neighborhood of } \underline{x}_0\}$$

We can introduce an algebraic structure by for all $f, g \in \mathcal{S}(\underline{x}_0)$ and $c \in \mathbb{R}$,

$$f + g : U_f \cap U_g \rightarrow \mathbb{R}, \quad fg : U_f \cap U_g \rightarrow \mathbb{R}, \quad cf : U_f \rightarrow \mathbb{R}.$$

Also we define

$$\mathcal{D}(\underline{x}_0) = \{f \in \mathcal{S}(\underline{x}_0) \mid \text{differentiable at } \underline{x}_0\}.$$

A mapping $L : \mathcal{S}(\underline{x}_0) \rightarrow \mathbb{R}$ is linear if for any $a, b \in \mathbb{R}$ and $f, g \in \mathcal{S}(\underline{x}_0)$, we have

$$L(af + bg) = aLf + bLg.$$

Remark 1.10. $\mathcal{S}(\underline{x}_0)$ is not a vector space since the additive identity is not unique.

Lemma 1.1. Let $f \in \mathcal{D}(\underline{x}_0), g \in \mathcal{S}(\underline{x}_0)$ such that $f(\underline{x}_0) = 0$, then $f \cdot g \in \mathcal{D}(\underline{x}_0)$.

Proof. Exercise. □

Definition 1.18. D is called a tangent vector to $\underline{x}_0 \in \mathbb{R}^N$, if

- 1). $D : \mathcal{D}(\underline{x}_0) \rightarrow \mathbb{R}$ is a linear map,
- 2). $D1 = 0$
- 3). For any $f, g \in \mathcal{D}(\underline{x}_0)$, such that $f(\underline{x}_0) = g(\underline{x}_0) = 0$, then $D(fg) = 0$.

Proposition 1.13. D satisfies the following properties.

1. D satisfies the Leipniz rule.
2. $\frac{\partial}{\partial x_i}|_{\underline{x}_0}$ is a tangent vector at \underline{x}_0 .
3. The sets of tangent vectors at D form a vector space and it has a basis consists $\frac{\partial}{\partial x_i}|_{\underline{x}_0}$ where $1 \leq i \leq N$.

Proof. Exercise. □

Definition 1.19. The vector space of tangent vectors at \underline{x}_0 is called the tangent space at \underline{x}_0 and denoted by $T_{\underline{x}_0}$. Its dual space is called the cotangent space and denoted by $T_{\underline{x}_0}^*$.

Example 1.3. Let $f \in \mathcal{D}(\underline{x}_0)$, we define

$$df : T_{\underline{x}_0} \rightarrow \mathbb{R}, \quad df(D) = Df,$$

is an element of the contangent space called the total differentiation.

Proposition 1.14. *The dx_i where $i = 1, \dots, N$ is a basis for the cotangent space $T_{\underline{x}_0}^*$. Such basis is a dual basis to $\{\frac{\partial}{\partial x_i}\}_{i=1, \dots, N}$.*

Definition 1.20. *Let $M \subseteq \mathbb{R}^N$. A Pfaffian form or (1-form) on M associates each point $\underline{x} \in M$ to a cotangent vector $a(\underline{x}) \in T_{\underline{x}}^*$. From the basis of the cotangent spaces, we know*

$$a(\underline{x}) = \sum_{i=1}^N a_i(\underline{x}) dx_i$$

where $a_i : M \rightarrow \mathbb{R}$.

We call a is continuous, differentiable, or measurable, if all a_i are so.

Remark 1.11. 1-forms on M a module over $E^0(M)$, where $E^0(M)$ is a ring of functions.

Definition 1.21 (Exterior Products). $E^p(M) = \bigwedge^p E^1(M)$ module of p -forms, $p = 0, \dots, N$. We call an element a of $E^p(M)$, a p -dimensional differential form, which is of the form

$$a = \sum_{\substack{I \subseteq \{1, \dots, N\} \\ |I|=p}} a_I dx^I.$$

where dx^I denotes that

$$dx^I = dx_{i_1} \wedge \cdots \wedge dx_{i_N}, i_j \in I, k < l \Rightarrow i_k \leq i_l.$$

The rank of E^p is $\binom{N}{p}$.

Definition 1.22. We define

$$E = \bigoplus_{1 \leq p \leq N} E^p.$$

The rank of E is $\sum_{p=0}^N \binom{N}{p} = 2^N$.

Remark 1.12. Let f be a differential function on an open set $M \subset \mathbb{R}^N$. We get a 1-form by

$$M \ni x \mapsto [df(x) \in T_x^*],$$

called the total differential and this is of the form

$$df = \sum_{i=1}^N \frac{\partial f}{\partial x_i} dx_i.$$

Definition 1.23. Let $a \in E^p$. a is said to be sufficiently differentiable if

$$a = \sum_I a_I dx^I,$$

then

$$da = \sum_I da_I \wedge dx^I \in E^{p+1},$$

where a_I is a differentiable function since a is differentiable. Thus we can consider the total differentiable of a_I .

Let a be a p -form. At each $x \in M$, we have a p -covector

$$a(x) \in \bigwedge^p T_x^*.$$

Definition 1.24. An exterior product is $E^p \times E^q \rightarrow E^{p+q}$ is such that

$$(a, b) \mapsto a \wedge b.$$

Note that we have

$$a \wedge b = (-1)^{p+q} b \wedge a.$$

In particular, if p is odd, we have,

$$a \wedge a = 0.$$

Moreover,

$$dx_i \wedge dx_i = 0.$$

Lieb 3 chapter number 3

Theorem 1.15.

$$d \wedge d = 0$$

and

$$d(a \wedge b) = da \wedge b + (-1)^p a \wedge db$$

where $a \in E^p(M)$, and whenever these expression make sense.

Definition 1.25 (Transformation of Forms). Let $F : R^N \supseteq U \rightarrow V \subseteq \mathbb{R}^M$, $F = (f_1, \dots, f_n)$ and $a \in E^p(V)$ where

$$a = \sum_I a_I dy^I.$$

We define $a \circ F$ to be

$$a \circ F = \sum_I a_I \circ F df^I.$$

Then this yields a p -form on U . We denote this by F^*a .

Theorem 1.16.

$$d(a \circ F) = da \circ F.$$

In other words, total differential commutes with pullbacks.

1.6 Integration

Definition 1.26. Let $M \subseteq \mathbb{R}^N$ and $a \in E^N(M)$ such that

$$a = \tilde{a} d_1 \wedge \cdots \wedge d_N.$$

We define

$$\int_M a = \int_M \tilde{a}(x) dx_1 \wedge \cdots \wedge dx_n.$$

Definition 1.27. Let a be a k -form in \mathbb{R}^N and M be a k -dimensional surface on \mathbb{R}^N such that

$$F : Q \rightarrow M$$

parametrizes M where Q is some cube.

$$\int_M a = \int_Q a \circ F.$$

Theorem 1.17 (Stokes). Let $\mathcal{G} \subset\subset \mathbb{R}^N$ be a relatively compact domain such that $\partial\mathcal{G}$ is $N - 1$ dimensional sufficiently smooth. A $N - 1$ -form defined and continuously differentiable on $\overline{\mathcal{G}}$, then

$$\int_{\partial\mathcal{G}} a = \int_{\mathcal{G}} da.$$

Lieb volume 3 chapter 3 integration

Now we define these notions in terms of complex analysis.

Definition 1.28. Let $M \subset \mathbb{C}^n$ then $E_{\mathbb{C}}^0(M)$ denotes the \mathbb{C} -valued functions on M , and

$$E_{\mathbb{C}}^p(M) = E^p(M) \underset{E^0(M)}{\otimes} E_{\mathbb{C}}^0(M).$$

A p -form on M is defined as

$$a = \sum_{j=1}^n a_j dx_j + \sum_{j=1}^n b_j dy_j$$

where $z_j = x_j + iy_j$ and a_j, b_j are complex-valued functions.

If we have $f = g + ih$, then we have $df = dg + idh$. In particular ,

$$dz_j = dx_j + idy_j, \quad d\bar{z}_j = dx_j - idy_j.$$

Thus we could write instead,

$$a = \sum_{j=1}^n \tilde{a}_j dz_j + \sum_{j=1}^n \tilde{b}_j d\bar{z}_j.$$

Remark 1.13. Let $a \in E_{\mathbb{C}}(M)$ then

$$a = \sum_{r=p+1, 0 \leq r \leq 2n} \sum_{\substack{1 \leq i_1 \leq \dots \leq i_p \leq N \\ 1 \leq j_1 \leq \dots \leq j_q \leq N}} a_{i_1, \dots, i_p, j_1, \dots, j_q} dz_{i_1} \wedge \dots \wedge dz_{i_p} \wedge d\bar{z}_{j_1} \wedge \dots \wedge d\bar{z}_{j_q}.$$

This can also be written as

$$a = \sum_{\substack{I, J \subseteq \{1, \dots, n\}, \\ |I|=p, \\ |J|=q}} a_{I, J} dz^I d\bar{z}^J.$$

Thus

$$E^r(M) = \bigoplus_{p+q=r} E^{p,q},$$

and

$$E_{\mathbb{C}}(M) = \bigoplus_{r=0, \dots, 2n} E^r(M) = \bigoplus_r \bigoplus_{p,q} E^{p,q}(M).$$

The rank of $E_{\mathbb{C}}(M) = \sum \binom{n}{p} \binom{n}{q} = 2^n$.

Consider

$$da = \sum_{I, J} da_{I, J} \wedge dz^I d\bar{z}^J,$$

In particular,

$$da = \sum a_j dz_j + \sum b_k d\bar{z}_k,$$

for

$$a_j = \frac{\partial a}{\partial z_j}, \quad b_k = \frac{\partial a}{\partial \bar{z}_k}.$$

Therefore

$$df = \partial f + \bar{\partial} f = \sum \frac{\partial f}{\partial z_j} dz_j + \sum \frac{\partial f}{\partial \bar{z}_k} d\bar{z}_k.$$

Thus we get

$$\partial : E^{p,q} \rightarrow E^{p+1,q}$$

and

$$\bar{\partial} : E^{p,q} \rightarrow E^{p,q+1}$$

Proposition 1.15. From the remark above, we have the following statements.

- 1). $d = \partial + \bar{\partial}$,
- 2). $d \circ d = 0, \partial \bar{\partial} + \bar{\partial} \partial = \partial \circ \partial = \bar{\partial} \circ \bar{\partial} = 0$.
- 3). Let f be a function, f is holomorphic if and only if $\bar{\partial}f = 0$
- 4). commutativity for \wedge holds,
- 5). Leibniz rules hold for $\partial(f \wedge g)$.

Example 1.4.

$$dx_1 \wedge dy_1 \wedge \cdots \wedge dx_n \wedge dy_n = -\left(\frac{1}{n}\right)^n dz_1 \wedge d\bar{z}_1 \wedge \cdots \wedge dz_n \wedge d\bar{z}_n.$$

This is called the volume form dV .

$$\int_M dV = \int d\lambda(z) = \lambda(M),$$

where λ is the Lebesgue measure.

Example 1.5. The Cauchy kernel.

$$C(\underline{\zeta}, \underline{z}) = \left(\frac{1}{2\pi i}\right)^n \frac{d\underline{\zeta}}{(\underline{\zeta} - \underline{z})}.$$

This is a form of type $(n, 0)$ in $\underline{\zeta}$.

$$\mathbb{C}^n \times \mathbb{C}^n - \Delta,$$

where $\Delta = \{(\underline{\zeta}, \underline{z}) \mid \forall j = 1, \dots, n \zeta_j = z_j\}$.

Proposition 1.16 (Transformation Rules). Let $F : U \rightarrow V$ be holomorphic where $U \subset \mathbb{C}^n$ and $V \subset \mathbb{C}^m$. For $a \in E^{p,q}(V)$,

$$a \circ F = \left(\sum_{I,J} a_{I,J} dw^I \wedge d\bar{w}^J \right) \circ F = \sum_{I,J} a_{I,J} \circ F(dw^I \circ F) \wedge (d\bar{w}^J \circ)$$

where $F = (f_1, \dots, f_n)$ and

$$dw_j \circ F = d(w_j \circ F) = df_j$$

for each j and similarly for $d\bar{w}_j$.

In particular, we have $a \in E^{p,q}(V)$, $a \circ F \in E^{p,q}(U)$. If F is just differentiable we get $a \circ F \in E^{p+q}(U)$.

Proposition 1.17. Let $F : U \rightarrow V$ be differentiable and $a \in E^{p,q}(V)$, we have

$$d(a \circ F) = da \circ F.$$

Furthermore, if F is holomorphic, we have,

$$\partial(a \circ F) = \partial a \circ F, \bar{\partial}(a \circ F) = \bar{\partial} \circ F.$$

Definition 1.29 (Poincaré Equation). Let $\mathcal{G} \subseteq \mathbb{R}^N$ be a domain and $f \in E^r$ such that $df = 0$. The equation

$$du = f,$$

is called the Poincaré equation.

Definition 1.30. Let $a \in E^r$. a is called

- 1). a closed form if $da = 0$.
- 2). an exact form if there exists $u \in E^{r-1}$ such that $du = a$.

Theorem 1.18. If the domain is convex in the above then the Poincaré equation is solvable. (ie. all the de Rham cohomologies are $r = 0$ except the 0 temr.)

Furthermore,

$$\begin{aligned} Z^r &= \{f \in E^r \mid df = 0\}, \\ B^r &= \{du \mid u \in E^{r-1}\}. \end{aligned}$$

We have $B^r \subset Z^r$, $H_{dR}^r(\mathcal{G}) = Z^r / B^r$, gives the de Rham cohomology and

$$H_{dR}^0(\mathcal{G}) = \mathbb{C},$$

if $r \neq 0$, then

$$H_{dR}^r(\mathcal{G}) = 0.$$

Note that B^0 is empty as there is no such thing as -1 -form.

Definition 1.31. Let $\mathcal{G} \subset \mathbb{C}^n$, $f \in E^{p,q}$. Consider the equation,

$$\bar{\partial}u = f \quad u \in E^{p,q-1}.$$

If such equation holds, then we necessarily have $\bar{\partial}f = 0$. We get

$$\bar{\partial}u = f, \bar{\partial}f = 0$$

in \mathcal{G} . We define similarly,

$$\begin{aligned} Z^{p,q} &= \{f \in E^{p,q} \mid \bar{\partial}f = 0\}, \\ B^{p,q} &= \{\bar{\partial}u \mid u \in E^{p,q-1}\}, \\ H_{dR}^{p,q}(\mathcal{G}) &= Z^{p,q} / B^{p,q} \end{aligned}$$

This cohomology is called Dolbeault cohomology. This gives

$$H^{0,0}(\mathcal{G}) = \mathcal{O}(\mathcal{G})$$

the sheaf of holomorphic functions.

1.7 Bochner-Martinelli Integral Formulas

Definition 1.32. We define the form

$$\beta = \beta(\underline{\zeta}, \underline{z}) = \sum_{j=1}^n (\bar{\zeta}_j - \bar{z}_j) d\zeta_j.$$

We also define

$$B(\underline{\zeta}, \underline{z}) = \left(\frac{1}{2\pi i} \right) \frac{1}{\|\underline{\zeta} - \underline{z}\|^{2n}} \beta \wedge (\bar{\partial}_{\zeta} \beta)^{n-1},$$

where

$$\bar{\partial}_{\zeta} \beta = \sum_{j=1}^n d\bar{\zeta}_j \wedge d\zeta_j = \sum_{j=1}^n \omega_j$$

where $\omega_j = d\bar{\zeta}_j \wedge d\zeta_j$ and the power means the exterior product. This B above is called the Bochner-Martinelli formel which is define on $\mathbb{C}^n \times \mathbb{C}^n$ except the diagonal.

Remark 1.14. For $n = 1$, we have

$$B = \frac{1}{2\pi i} \frac{1}{(\zeta - z)(\bar{\zeta} - \bar{z})} (\bar{\zeta} - \bar{z}) d\zeta = \frac{1}{2\pi i} \frac{d\zeta}{\zeta - z}.$$

Remark 1.15. Given a $(n, n-1)$ form in ζ which is a function in z .

Lemma 1.2.

$$d_{\zeta} B(\underline{\zeta}, \underline{z}) = \bar{\partial}_{\zeta} B(\underline{\zeta}, \underline{z}) = 0.$$

Proof. For $z = 0$, we get

$$\beta = \sum_j \bar{\zeta}_j d\zeta_j, \quad \omega^j = d\bar{z}_j \wedge d\zeta_j.$$

If $K \subset \{1, \dots, n\} = N$, then

$$\omega^K = \bigwedge_{j \in K} \omega^j.$$

We already know,

$$\bar{\partial} \beta = \sum \omega_j,$$

and

$$(\bar{\partial} \beta)^k = \left(\sum \omega_j \right)^k = k! \sum_{|K|=k} \omega^K.$$

Furthermore,

$$\bar{\partial}_{\zeta} \|\underline{\zeta}\|^2 = \bar{\partial} \sum \bar{\zeta}_j \zeta_j = \sum \zeta_j d\bar{\zeta}_j = \bar{\beta}.$$

$$\begin{aligned} (2\pi i)^n \bar{\partial} B(\underline{\zeta}, \underline{z}) &= \bar{\partial} (\beta \wedge (\bar{\partial})^{n-1} \frac{1}{\|\zeta\|^{2n}}) \\ &= \frac{-n\bar{\beta}}{\|\zeta\|^{2n+2}} \wedge \beta \wedge (\bar{\partial}_{\zeta} \beta)^{n-1} + \frac{1}{\|\zeta\|^{2n}} (\bar{\partial} \beta)^n \\ &= \frac{1}{\|\zeta\|^{2n}} \left[\frac{-n\bar{\beta} \wedge \beta}{\|\zeta\|^2} + \bar{\partial} \beta \right] \wedge (\bar{\partial} \beta)^{n-1}. \end{aligned}$$

In particular,

$$\bar{\beta} \wedge \beta = \sum_{j,k} \zeta_j \bar{\zeta}_k d\bar{\zeta}_j \wedge d\zeta_k = \sum_{j \neq k} \zeta_j \bar{\zeta}_k d\bar{\zeta}_j d\zeta_k + \sum_j |\zeta_j|^2 d\omega_j.$$

Thus we get

$$\begin{aligned} \bar{\beta} \wedge \beta \wedge (\bar{\partial}_{\zeta} \beta)^{n-1} &= 0 + \sum_j |\zeta_j|^2 \omega_j (n-1)! \sum_{k=1}^n \omega^{N+k} = (n-1)! \sum_{j=1}^n |\zeta_j|^2 \omega^N = (n-1)! \|\underline{\zeta}\|^2 \omega^N. \\ (2\pi i)^n \bar{\partial} B(\underline{\zeta}, 0) &= \frac{1}{\|\underline{\zeta}\|^{2n}} [-n! \omega^N + n! \omega^N] = 0. \end{aligned}$$

□

Theorem 1.19. Let $\mathcal{G} \subset \subset \mathbb{C}^n$ with $\partial\mathcal{G}$ is reasonable (ie. the Stoke's theorem holds.) Let $f \in C^1(\bar{\mathcal{G}})$, and $z \in \mathcal{G}$. We have

$$f(z) = \int_{\partial\mathcal{G}} f(\underline{\zeta}) B(\underline{\zeta}, \underline{z}) - \int_{\mathcal{G}} \bar{\partial} f(\underline{\zeta}) \wedge B(\underline{\zeta}, \underline{z}).$$

The special case is that for $n = 1$, we have,

$$f(z) = \frac{1}{2\pi i} \int_{\partial B} \frac{f(\zeta)}{\zeta - z} d\zeta + \frac{1}{2\pi i} \int_{\mathcal{G}} \frac{\partial f(\zeta)}{\partial \bar{\zeta}} \frac{1}{\zeta - z} d\zeta \wedge d\bar{\zeta}.$$

Proof. Observe that B has a singularity of order $\frac{1}{\|\zeta - z\|^{2n-1}}$ in $\mathbb{C}^n \cong \mathbb{R}^{2n}$ since β consists of linear terms. Using the Lemma above, we get and denote $\mathcal{G}_\varepsilon = \mathcal{G} \setminus \overline{B(z, \varepsilon)}$ for sufficiently small $\varepsilon > 0$.

$$\begin{aligned} \int_{\mathcal{G}_\varepsilon} \bar{\partial} f(\underline{\zeta}) \wedge B(\underline{\zeta}, \underline{z}) &= \int_{\mathcal{G}_\varepsilon} \bar{\partial}(f(\underline{\zeta}) B(\underline{\zeta}, \underline{z})), \\ &= \int_{\mathcal{G}_\varepsilon} d\underline{\zeta}(f(\underline{\zeta}) B(\underline{\zeta}, \underline{z})), \\ &= \int_{\partial\mathcal{G}_\varepsilon} f(\underline{\zeta}) B(\underline{\zeta}, \underline{z}), \\ &= \int_{\partial\mathcal{G}} f(\underline{\zeta}) B(\underline{\zeta}, \underline{z}) - \int_{\partial B(z, \varepsilon)} f(\underline{\zeta}) B(\underline{\zeta}, \underline{z}). \end{aligned}$$

Taking $\varepsilon \rightarrow 0$, we get

$$\int_{\mathcal{G}} \bar{\partial} f \wedge B = \int_{\partial\mathcal{G}} f(\underline{\zeta}) B(\underline{\zeta}, \underline{z}) - \lim_{\varepsilon \rightarrow 0} \int_{\partial B(z, \varepsilon)} f(\underline{\zeta}) B(\underline{\zeta}, \underline{z}).$$

□

Remark 1.16. In \mathbb{R}^n and $\alpha < n$, we have

$$\int_{B(0,R)} \frac{dV}{r^\alpha} < \infty,$$

and if $\alpha > n$, we have

$$\int_{\mathbb{R}^n \setminus B(0,R)} \frac{dV}{r^\alpha} < \infty,$$

but if $\alpha = n$, neither of them exists.

Lemma 1.3. Let us define,

$$B^1(\underline{\zeta}, \underline{z}) = (n-1) (2\pi i)^n \frac{1}{(\|\underline{\zeta} - \underline{z}\|)^{2n}} \beta \wedge (\bar{\partial}_\zeta \beta)^{n-2} \bar{\partial}_z \beta$$

Then we have

$$\bar{\zeta}_z B(\underline{\zeta}, \underline{z}) = \bar{\partial}_\zeta B^1(\underline{\zeta}, \underline{z}).$$

Let \mathcal{G} be a domain and consider a ball $B(z, \varepsilon)$ inside \mathcal{G} . We know that

$$\int_{\mathcal{G}} \bar{\partial} f(\zeta) \wedge B(\zeta, z) = \int_{\partial \mathcal{G}} f(\zeta) B(\zeta, z) - \lim_{\varepsilon \rightarrow 0} \int_{S_\varepsilon} f(\zeta) B(\zeta, z).$$

Examine the last term,

$$\int_{S_\varepsilon} f(\zeta) B(\zeta, z) = \left(\frac{1}{2\pi i} \right)^n \frac{1}{\varepsilon^{2n}} \int_{\partial \mathcal{G}} f(\zeta) \tilde{B}(\zeta, z),$$

where

$$\tilde{B}(\zeta, z) = \beta \wedge (\bar{\partial} \beta)^{n-1}.$$

That is

$$\int_{S_\varepsilon} f(\zeta) \tilde{B}(\zeta, z) = \int_{S_\varepsilon} (f(\zeta) - f(z)) \tilde{B}(\zeta, z) + f(z) \int_{S_\varepsilon} \tilde{B}(\zeta, z).$$

Call the integrals on the right hand side I_1, I_2 , respectively.

Clearly we have,

$$|I_1| \leq \max_{\zeta \in B_\varepsilon} |f(\zeta) - f(z)| c_1 \cdot \varepsilon \cdot c_2 \cdot \varepsilon^{2n-1},$$

where the constants c_1 depends on β and c_2 depends on . Furthermore,

$$\leq c_1 c_2 \varepsilon^{2n} \max |f(\zeta) - f(z)|.$$

Therefore, the upper bound can be

$$\left| \frac{1}{2\pi i} \frac{1}{\varepsilon^{2n}} I_1 \right| \leq c \max |f(\zeta) - f(z)|.$$

By the continuity, we have $\varepsilon \rightarrow 0$, then $\zeta \rightarrow z$ thus I_1 vanishes as we take the limit.

For the another term, by applying Stoke's theorem,

$$I_2 = f(z) \int_{S_\varepsilon} \tilde{B}(\zeta, z) = f(z) \int_{B_\varepsilon} d\zeta \tilde{B}(\zeta, z).$$

Substituting the definition of \tilde{B} , we get,

$$= f(z) \int_{B_\varepsilon} (\bar{\partial}\beta)^n.$$

Furthermore,

$$\bar{\partial}\beta = \sum_j \bar{\zeta}_j \wedge d\zeta_j = \sum_j \omega_j.$$

Thus we obtain,

$$f(z)n! \int_{B_\varepsilon} \omega_1 \wedge \cdots \wedge \omega_n = n! \int_{B_\varepsilon} d\text{Vol}(2\pi i)^n = n! \frac{\pi^n}{n!} \varepsilon^{2n} (2i)^n = (2\pi i)^n \varepsilon^{2n}.$$

Thus taking $\varepsilon \rightarrow 0$, we get

$$I_2 \rightarrow f(z) \int_{S_\varepsilon} B(\zeta, z) = f(z).$$

Theorem 1.20. *Let \mathcal{G} be a domain with $\partial\mathcal{G}$ resonable.*

If f is holomorphic on $\bar{\mathcal{G}}$, then for any $z \in \mathcal{G}$, we have

$$f(z) = \int_{\partial\mathcal{G}} f(\zeta) B(\zeta, z).$$

If f is holomorphic on a neighborhood U of \mathcal{G} , then we have

$$F(z) = \int_{\partial\mathcal{G}} f(\zeta) B(\zeta, z),$$

is holomorphic on \mathcal{G} .

Proof. We compute the Following

$$\bar{\partial}_z F(z) = \int_{\partial\mathcal{G}} f(\zeta) \bar{\partial}_z B(\zeta, z).$$

By Lemma 1.3, we get

$$\begin{aligned} &= \int_{\partial\mathcal{G}} f(\zeta) \bar{\partial}_\zeta B^1(\zeta, z), \\ &= \int_{\partial\mathcal{G}} \bar{\partial}_\zeta (f(\zeta) B^1(\zeta, z)), \\ &= \int_{\partial\mathcal{G}} d\zeta (f(\zeta) B^1(\zeta, z)), \\ &= \int_{\partial\partial\mathcal{G}} \cdots = 0. \end{aligned}$$

The last equality follows from the exactness. \square

Theorem 1.21 (Hartogos' Kugelsatz or Hartogos' Ball Theorem). *For $n > 1$, let $U \subset \mathbb{C}^n$ be open and $K \subset U$ be compact. Assume U, K are both connected. If f is holomorphic on $U \setminus K$, there is F on U such that*

$$F|_{U \setminus K} = f.$$

In other words, f extends holomorphically to the whole U .

Proof. Let $\mathcal{G}_0, \mathcal{G}$ be domains such that $K \subset \mathcal{G}_0 \subset \mathcal{G}$ and $\mathcal{G}_0, \mathcal{G}$ have reasonable boundaries. Let $z \in \mathcal{G} \setminus \overline{\mathcal{G}_0}$. Using Bochner-Martinelli, we get

$$f(z) = \int_{\partial \mathcal{G}} f(\zeta) B(\zeta, z) - \int_{\partial \mathcal{G}_0} f(\zeta) B(\zeta, z) = F_1(z) - F_2(z).$$

Let us denote the two integral terms on the right hand sides $F_1(z), F_2(z)$, respectively. F_1 is holomorphic in z on \mathcal{G} , and F_2 is holomorphic in z on $\mathbb{C}^n \setminus \mathcal{G}_0$.

Let L be a complex line such that $L \cap \mathcal{G}_0 = \emptyset$. By construction,

$$F_2(z) = \int \frac{\text{something bounded}}{\|\zeta - z\|^{2n}} \|\zeta - z\| \rightarrow 0,$$

as $z \rightarrow \infty$ under the assumption $n > 1$. Restating $z \rightarrow \infty \Rightarrow F_2(z) \rightarrow 0$.

Observe that $F_2|L \equiv 0$, by Liouville's theorem using the single variable complex analysis. In general, $F_2 \equiv 0$ on any open subsets $U \setminus K$. By the connectedness, we conclude $F_2 \equiv 0$ on $U \setminus K$.

Thus we conclude that

$$F_1 \equiv f \text{ on } \mathcal{G} \setminus K$$

yields the holomorphic extension. \square

Corollary 1.4. *There are no isolated singularities nor isolated zeros for $n > 1$.*

Proof. Suppose a function f has a singularity at z_0 . Suppose f is holomorphic on $U \setminus \{z_0\}$. By the theorem above and $\{z_0\}$ is compact, we see f can be holomorphically extended to U . We derived a contradiction.

Similarly, if f has 0 at z_0 and $\frac{1}{f}$ is holomorphic on $U \setminus \{z_0\}$, then by the same argument, we derived a contradiction. \square

Remark 1.17 (Caution!!). *Suppose we are given a holomorphic function f on variable at least 2, such that*

$$f = g + ih.$$

where $g, h : \mathbb{R}^2 n \rightarrow \mathbb{R}$. Then

$$V(f) = V(g) \cap V(h),$$

where $V(f)$ denotes the set of zeros of f . Observe that $V(g), V(h)$ are $2n - 1$ dimensional sets thus the intersection is $2n - 2$ unless they do not coincide.

Theorem 1.22 (Cauchy/Pmperi). Let \mathcal{G} be a domain with a reasonable boundary $\partial\mathcal{G}$ such that $\mathcal{G} \subset\subset \mathbb{C}$. Let $f \in \mathcal{C}^1(\overline{\mathcal{G}})$. For $z \in \mathcal{G}$, we have

$$f(z) = \frac{1}{2\pi i} \int_{\partial\mathcal{G}} \frac{f(\zeta)}{\zeta - z} d\zeta + \frac{1}{2\pi i} \int_{\mathcal{G}} \frac{\frac{\partial f}{\partial \bar{\zeta}}(\zeta)}{\zeta - z} d\zeta \wedge d\bar{\zeta}.$$

Apply $f \in \mathcal{C}^1(\overline{\mathcal{G}})$, and solve,

$$\frac{\partial u}{\partial \bar{z}} = f.$$

Proof. Assume u is a solution $\in \mathcal{C}(\overline{\mathcal{G}})$,

$$u(z) = \frac{1}{2\pi i} \int_{\partial\mathcal{G}} \frac{u(\zeta)}{\zeta - z} d\zeta + \frac{1}{2\pi i} \int_{\mathcal{G}} \frac{f(\zeta)}{\zeta - z} d\zeta \wedge d\bar{\zeta}.$$

By the assumption, we get

$$f(z) = \frac{\partial u}{\partial \bar{z}} = \frac{\partial}{\partial \bar{z}} \frac{1}{2\pi i} \int_{\mathcal{G}} \frac{f(\zeta)}{\zeta - z} d\zeta \wedge d\bar{\zeta}.$$

□

Theorem 1.23. Let $\mathcal{G}, \partial\mathcal{G}$ as before in \mathbb{C} . Suppose $f \in \mathcal{C}^1(\mathcal{G}) \cap L^1(\mathbb{C})$. Then there is a solution $u \in \mathcal{C}^1(\mathcal{G})$ such that u solves,

$$\frac{\partial u}{\partial \bar{z}} = f.$$

For $n > 1$, and $\mathcal{G}, \partial\mathcal{G}$ a domain with a reasonable boundary. We see $f \in \mathcal{C}_{0,1}^1(\overline{\mathcal{G}})$, $\bar{\partial}f = 0$. We get

$$\bar{\partial}u = f.$$

Suppose such u exists. By Bochner-Martinelli, we get

$$u(z) = \int_{\partial\mathcal{G}} u(\zeta) B(\zeta, z) - \int_{\mathcal{G}} f(\zeta) \wedge B(\zeta, z).$$

Then we get

$$f = \bar{\partial}u = \bar{\partial} \int_{\partial\mathcal{G}} \cdots - \partial \int_{\mathcal{G}} \cdots.$$

However, the first integral term on the right hand side does not equal 0.

1.8 Hartogos Levi problems.

The first problem is, given $n > 1$, there exists a domain \mathcal{G} such that all holomorphic functions on \mathcal{G} extends holomorphically to a larger domain.

Characterize the domains where this does not happen.

Definition 1.33. A domain of holomorphy is a domain such that there exists a holomorphic function on it which cannot be extended holomorphically to a larger domain.

The second problem is that if \mathcal{G} is a domain of holomorphy, can we have a function theory there?

Example 1.6. \mathbb{C} is a domain of holomorphy as it cannot be extended to a larger domain. Let f_1, f_2 be entire functions which are holomorphic in \mathbb{C} which do not have common zeros.

Solve the Diophantine equation,

$$g_1 f_1 + g_2 f_2 \equiv 1.$$

The solutions indeed exists. Assume that the zeros $\{a_1, \dots\}$ of f_2 are simple and set

$$c_i = f_1(a_i).$$

Find g_1 with

$$g_1(a_i) = \frac{1}{c_i}.$$

Set g_2 to be

$$g_2 = \frac{1 - g_1 f_1}{f_2}.$$

Example 1.7. Let $\mathcal{G} = \mathbb{C}^2 \setminus \{0\}$, Let us define

$$f_1 = z_1, f_2 = z_2.$$

If we have

$$g_1 z_1 + g_2 z_2 = 1$$

on \mathcal{G} .

The third problem is Study the zero set of holomorphic function. This leads to analytic sets.

2 Power Series

2.1 Generalities

Notation 2.1. We will use the following conventions.

- 1). $\mathbb{N}_0 = \mathbb{N} \cup \{0\}$
- 2). $\mathbb{N}_0^n = \{\alpha = (\alpha_1, \dots, \alpha_n) \mid 1 \leq i \leq n, \alpha_i \in \mathbb{N}_0\}$
- 3). $z = (z_1, \dots, z_n)$
- 4). For $\alpha \in \mathbb{N}_0^n$, $z^\alpha = \prod_{i=1}^n z_i^{\alpha_i}$
- 5). $|\alpha| = \sum_{i=1}^n \alpha_i$.
- 6). $f = f(z) = \sum_{\alpha \in \mathbb{N}_0^n} a_\alpha z^\alpha$

Definition 2.1. We define the formal power series as

$$f = \sum_{j \in \mathbb{N}_0} f_j,$$

where f is homogeneous polynomial of degree j . The sums and products are given by

$$f + g = \sum_{i \in \mathbb{N}_0} f_i + g_i, \quad fg = \sum_{i=0}^n \sum_{j+k=i} f_j g_k.$$

The ring of formal power series with the above operation over a commutative ring \mathbb{C} is denoted by

$$\mathbb{C}[[z]].$$

Definition 2.2. Let $f = \sum_{i \in \mathbb{N}_0} f_i$, then we define the order of f to be the minimum index i such that $f_i \neq 0$. We will denote this by $o(f)$.

Proposition 2.1. Let $f, g \in \mathbb{C}[[z]]$, we have

- 1). $o(f) \geq 0$ for any non-zero element. Moreover $o(f) = 0$ if and only if f is a unit.
- 2). $o(f) = \infty \Leftrightarrow f \equiv 0$
- 3). $o(fg) = o(f) + o(g)$
- 4). $o(f+g) \geq \min\{o(f), o(g)\}$

It follows that $\mathbb{C}[[z]]$ is an integral domain.

Corollary 2.1. $\mathbb{C}[[z]]$ has a unique maximal ideal.

$$\mathfrak{m} = \{f \in \mathbb{C}[[z]] \mid o(f) > 0\}.$$

Definition 2.3 (Convergent Power Series). For any $\underline{r} \in \mathbb{N}_0^n$, we define $c_{\underline{r}} \in \mathbb{C}$, then

$$\sum_{\underline{r} \in \mathbb{N}_0^n} c_{\underline{r}} \tag{1}$$

converges to $c \in \mathbb{C}$ if for any $\varepsilon > 0$, there is a finite subset $J_0 \subset \mathbb{N}_0^n$ such that for all finite $J \subset \mathbb{N}_0^n$, with $J \supset J_0$ we have,

$$\left| \sum_{\underline{r} \in J} c_{\underline{r}} - c \right| < \varepsilon. \tag{2}$$

Proposition 2.2. The convergence of the series implies the absolute, unconditional convergence, and uniform convergence.

Definition 2.4. Let $c_{\underline{r}}$ be a function on M then

$$\sum_{\underline{r} \in \mathbb{N}_0^n} c_{\underline{r}} \xrightarrow{\vec{M}} c \quad (3)$$

if and only if for any $\varepsilon > 0$, there exists a finite set $J_0 \subset \mathbb{N}_0^n$ such that for all finite set with $J \supset J_0$, and all $x \in M$, we have

$$\left| \sum_{\underline{r} \in J} c_{\underline{r}}(x) - c(x) \right| < \varepsilon. \quad (4)$$

Example 2.1 (Geometric Series). Let $0 \leq q_i \leq 1$ for $i = 1, \dots, n$, then

$$\sum_{\underline{r} \in \mathbb{N}_0^n} \prod_{i=1}^n q_i^{r_i} = \prod_{i=1}^n \frac{1}{1 - p_i}. \quad (5)$$

Proposition 2.3. Let

$$f = \sum_{\underline{r} \in \mathbb{N}_0^n} a_{\underline{r}} z^{\underline{r}} \in \mathbb{C}[[z]].$$

Take

$$z_0 = (z_{0,1}, \dots, z_{0,n}) \in \mathbb{C}^n, z_j^0 \neq 0.$$

Then if there exists $S > 0$ such that

$$|a_{\underline{r}} z_0^{\underline{r}}| \leq S, \quad (6)$$

then $f(z)$ converges for all \underline{z} with

$$\forall j, |z_j| \leq z_{0,j}.$$

Converges uniformly for all \underline{z} such that there exists $r_j > 0$ with

$$|z_j| \leq r_j < |z_{0,j}|.$$

Corollary 2.2. A sum of power series is holomorphic function.

Remark 2.1 (Warning). If $f \in \mathbb{C}[[z]]$, the domain of convergence is equal to the interior of the set of convergence.

Example 2.2. Let

$$f(z_1, z_2) = z_2 \sum_{i=1}^{\infty} z_1^i.$$

Then the set of convergence is

$$\{(z_1, z_2) \mid z_2 = 0\} \cup \{(z_1, z_2) \mid |z_1| < 1\}.$$

The domain of convergence is

$$\{|z_1| < 1\}.$$

Definition 2.5. *The convergence set is logarithmically convex complete Reinhardt domain.*

Gr/FR Einführung Ch I.

Definition 2.6. *We define the ring of convergent power series to be*

$$\mathbb{C}\{z_1, \dots, z_n\} \subset \mathbb{C}[[z_1, \dots, z_n]],$$

which consists of those formal power series whose domain of convergence contains some neighborhood around the origin.

Remark 2.2. *This inherits the properties from $\mathbb{C}[[z_1, \dots, z_n]]$, namely, it is an integral domain, which is local with unique maximal ideals*

$$\mathfrak{m} = \{f \mid f(0) = 0\},$$

and units are the one such that $o(f) = 0$.

Remark 2.3. *It is clear that if f is a unit then there exists $g \in \mathbb{C}\{z_1, \dots, z_n\}$ such that $fg = 1$. Therefore,*

$$o(f) + o(g) = o(1) = 0.$$

Therefore $o(f) = 0$. if f is holomorphic at 0 and $f(0) \neq 0$. Then $\frac{1}{f}$ is also holomorphic at 0, therefore taking the taylor series of $\frac{1}{f}$ to be g , we obtain the desired unit.

Remark 2.4. *For $n = 1$, we get,*

$$(a_0 + a_1 z + \dots)(b_0 + b_1 z + \dots) = 1,$$

where $a_0 \neq 0$.

Definition 2.7. *Let $z \in \mathbb{C}^n$, f, g be holomorphic functions defined in z . We denote $f \cong g$ if f coincides with g on some neighborhood of z . Such equivalence classes are called the germs of holomorphic functions.*

Definition 2.8. *The ring of germs at $z_0 \in \mathbb{C}^n$ which is denoted by \mathcal{O}_{z_0} is isomorphic to $\mathbb{C}\{z - z_0\} \cong \mathbb{C}\{z\}$.*

Definition 2.9. *If f is a holomorphic function on U and $z \in U$. The germ of f at z is denoted by f_z or $\gamma_z f$ (ie. an equivalence class which is represented by the taylor series of f around z).*

Remark 2.5. *Let \mathcal{D}_z be the ring of smooth funtions defined arond z and \mathcal{C}_z be the continuous function defined around z , then we have*

$$\mathcal{O}_z \subset \mathcal{D}_z \subset \mathcal{C}_z. \tag{7}$$

Definition 2.10. *The sheaf of holomorphic function is defined to be*

$$\mathcal{O} = \bigsqcup_{z \in \mathbb{C}^n} \mathcal{O}_z,$$

together with a canonical projection $p : \mathcal{O} \rightarrow \mathbb{C}^n$.

Definition 2.11. *A (continuous) section in \mathcal{O} corresponding to an open set $U \subset \mathbb{C}^n$ is such that*

$$\sigma : U \rightarrow \mathbb{C}, p \circ \sigma = \text{id}, \sigma(z) \in \mathcal{O}_z. \quad (8)$$

There exists a holomorphic function f on U such that

$$\sigma(z) = f_z = \gamma_z f.$$

We define the topology over it by setting the base of the topology to be a collection consists of those $\sigma(U)$ where σ is a section and U is open in \mathbb{C}^n ,

Definition 2.12. *Let X, Y be topological space and $f : X \rightarrow Y$. f is said to be locally topological/homeomorphic if any point $x_0 \in X$, there exists open neighborhood U around x_0 and V around $f(x_0)$ such that*

$$f|_U : U \rightarrow V$$

is a homeomorphism.

Proposition 2.4. *\mathcal{O} is a Hausdorff space. $p : \mathcal{O} \rightarrow \mathbb{C}^n$ is continuous and locally topological(ie. locally homeomorphic). The fiber*

$$\mathcal{O}_z = p^{-1}(z) \quad (9)$$

The addition and multiplication are continuous.

We have the fiber product,

$$\mathcal{O} \times_p \mathcal{O} \xrightarrow{+} \mathcal{O} \quad (10)$$

with

$$\begin{array}{ccc} \mathcal{O} \times_p \mathcal{O} & \xrightarrow{\pi_1} & \mathcal{O} \\ \pi_2 \downarrow & & \downarrow p \\ \mathcal{O} & \xrightarrow[p]{} & \mathbb{C}^n \end{array}$$

We have a one-to-one correspondence between (continuous) sections and holomorphic functions.

We observe that \mathcal{O} is a structure sheaf of \mathbb{C}^n . This can also be generalized for \mathcal{D}, \mathcal{C} .

Remark 2.6. *The above proposition almost holds for \mathcal{D}, \mathcal{C} except that they are not Hausdorff.*

2.2 The Weierstrass Theorem

Notation 2.2.

$$H_n = \mathbb{C}\{z_1, \dots, z_n\} = \mathbb{C}\{z\}.$$

Definition 2.13. $f \in H_n$, then

$$f = \sum_{i=0}^{\infty} f_i z_n^i,$$

where $f_i \in H_{n-1}$.

Definition 2.14. $f \in H_n$ is called z_n -regular of order k if $f_i(0^1) = 0$ for $i = 0, \dots, k-1$ and $f_k(0^1) \neq 0$. That is to say

$$f(0^1, z_n) = az_n^k + \dots + a \neq 0.$$

Theorem 2.1 (Vorbereitungs Satz). Let $f \in H_n$ be z_n -regular of k . Then there are elements $e \in H_n, \omega \in H_{n-1}[z_n]$ with

1. e is a unit in H_n ,
2. $\omega = z_n^k + c_1(z^1)z_n^{k-1} + \dots + c_n(z')$.
3. $f = e \cdot \omega$.

Furthermore, e, ω are uniquely determined and

$$\omega(0^1, z_m) = z_m^k.$$

ie $c_r(0') = 0$. We call ω a Weierstrass polynomial.

Proof.

$$\begin{aligned} f(z) &= \sum_{i=0}^{k-1} c_i(z^1)z_n^i + z_n^k + \sum_{i=k+1}^{\infty} c_i(z^1)z_n^i, \\ &= z_n^k \left(1 + \sum_{i=0}^{k-1} c_i(z^1)z_n^{i-k} + \sum_{i=k+1}^{\infty} c_i(z^1)z_n^{r-k} \right), \\ &= z_n^k(1 + A + B), \end{aligned}$$

where

$$A = \sum_{i=0}^{k-1} c_i(z^1)z_n^{i-k}, \quad B = \sum_{i=k+1}^{\infty} c_i(z^1)z_n^{r-k}.$$

For $|z| \leq R$, the radius of convergence. Choose $\rho > 0$ with for $|z^1| \leq R, |z_n| \leq \rho$, we have

$$|B| < \frac{1}{2}, \frac{\rho}{2} \leq |z_n| \leq \rho.$$

Choose $\delta > 0$ for $|z| \leq \delta$ so that

$$|A| \leq \frac{1}{2}.$$

Let $A + B = W$, then

$$|W| \leq 1.$$

Thus we can consider,

$$\begin{aligned} \ln(1 + W) &= W - \frac{W^2}{2} + \frac{W^3}{3} - \dots, \\ &= C + D. \end{aligned}$$

where C stands for the taylor part, and D stands for the principle part in the Laurent expansion. Note that $1 + A + B$ is a Laurent expansion.

$$\begin{aligned} f(z) &= z_n^k(1 + W), \\ &= z_n^k \exp(\log(1 + W)), \\ &= z_n^k \exp(C) \exp(D). \end{aligned}$$

In particular, we have,

$$\exp(-C)f(z) = z_n^k \exp(D).$$

Observe that $\exp(-C)f(z)$ has only non-negative powers of z_n . By the uniqueness of Laurent expression, we conclude $z_n^k \exp(D)$ contains no negative powers of z_n . Examine the following

$$\begin{aligned} z_n^k \exp(D) &= z_n^k \left(1 + D + \frac{D^2}{2!} + \dots \right), \\ &= z_n^k + b_1(z^1)z_n^{k-1} + \dots + b_k(z^1), \\ &= \omega(z^1, z_n). \end{aligned}$$

Since $\exp(C)$ is invertible, it is a unit. Let $e = \exp(C)$, we obtain,

$$f(z) = e\omega(z^1, z_n).$$

For the uniqueness, the zeros of ω is the zeros of f . Thus ω is determined so is the unit e . Consider $f(0^1, z_n) = z_n^k + \text{higher order..}$ Also note that

$$f(0^1, z_n) = e(0^1, z_n)(z_n^k + b_1(0)z_n^{k-1} + \dots).$$

Compare the powers of z_n , we conclude ,

$$\omega(0^1, z_n) = z_n^k.$$

□

Proof. Write

$$f(z) = \sum_{i=0}^{k-1} c_i(z^1) z_n^i + z_n^k + \sum_{i>k} c_i(z^1) z_n^i.$$

where for all $i < k$,

$$c_i(0) = 0.$$

$$f(z) = z_n^k \left(\sum_{i>k} c_i(z') z_n^{i-k} + 1 \sum_{i>k} c_i(z') z_n^{i-k} \right) = z_n^k (A + B) = z_n^k (1 + W).$$

Indeed if $|z_n| \leq \rho$, then

$$|B| < \frac{1}{2}.$$

For A , take $\frac{\rho}{2} \leq |z_n| \leq \rho$, Find $\delta > 0$ such that

$$|z'| \leq \delta.$$

Then $|A| < \frac{1}{2}$.

$\frac{1}{2} \leq |z_n| \rho$, then $|W| < 1$. To see this

$$\log(1 + W) = W - \frac{W^2}{2} + \frac{W^3}{3} - \dots = C + D.$$

where C is the taylor expansion part and D is the principal part.

$$f(z) = z_n^k \exp(\log(1 + W)) = z_n^k \exp(C + D) \Rightarrow e^{-C} f(z) = z_n^k \exp D.$$

On the left hand side, it is powers in z_n , so is the right hand side. Namely D consists of only regular powers of z_n .

$$z_n^k (1 + D + \frac{D^2}{2} + \dots) = z_n^k + a_1(z') z_n^{k-1} + a_2(z') z_n^{k-2} + \dots + a_n(z') + \text{Remainder}.$$

Since the Laurent development is unique we conclude the remainder part to be 0.

We will set

$$\omega(z', z_n) = z_n^k + a_1(z') z_n^{k-1} + a_2(z') z_n^{k-2} + \dots + a_n(z'),$$

We now have the decomposition,

$$f(z) = e^C \omega(z', z_n).$$

Note that e^C is a unit. Thus we both proved the existence and the uniqueness. \square

Theorem 2.2 (Weierstrass Formal Division Theorem). *Let $g \in H_n$ be z_n -regular of order k . Then for each $f \in H_n$, there are elements $q \in H_{n-1}, r \in H_{n-1}[z_n]$ where $\deg_{z_n} r < k$ which are uniquely determined with*

$$f = qg + r.$$

Proof. By Weierstrass Vorbereitungs satz, we may assume that $g = e\omega$ where ω is the Weierstrass polynomial of order k . Without the loss of generality, we may assume $e = 1$. Thus, we have,

$$g = z_n^k \exp(D),$$

where D is regular polynomial of z_n . Similarly as in the previous statement, we get

$$\frac{f}{g} = q + H,$$

where q is the taylor part, and H is the principle part. We have,

$$f = qg + gH \Rightarrow f - qg = gH.$$

Let $r = gH$, we see $f - qg$ has only non-negative powers of z_n . Therefore gH also contains no negative powers. In particular the power in H is a polynomial of degree at most $k - 1$.

Thus we obtained,

$$f = qg + r.$$

For the uniqueness, it is enough to consider,

$$0 = qg + r.$$

However, observe that

$$-qg = r,$$

on the left hand side, qg is of order k , but $\deg_{z_N} r < k$. We conclude $q, r = 0$. \square

Corollary 2.3. *If in the formula*

$$f = qg + r.$$

If $g = \omega$ a Weierstrass polynomial and f is a polynomial in $H_{n-1}[z_n]$ of degree m , then q is a polynomial of degree $n - k$ or it is identically 0.

if f is a polynomial of degree n in the Weierstrass Vorbereitungs satz, then e is a polynomial of degree $n - k$.

Proof. For the first claim, it follows from Euclidean division. For the second claim, $f = e\omega$, then this is nothing but a division of f by ω . Therefore, e must be a polynomial. \square

Corollary 2.4. *Suppose $f_1, \dots, f_m \in H_n \setminus \{0\}$. Then there is a linear transformation, $\sigma : \mathbb{C}^n \rightarrow \mathbb{C}^n$ such that $f_j \circ \sigma$ are z_n -regular of order k_j .*

Proof. Find a line L in H_n such that $f_j|_L \neq 0$. Change the coordinate so that L appears as an axis. \square

Remark 2.7. *Weierstrass Vorbereitungs satz and Weierstrass Formal Division Theorem are true for over power series over completely*

Remark 2.8. A natural proof for these theorems are,

$$f(z) = e(z)\omega(z^1, z_n).$$

leads to equivalence system for the coefficients monomials.

Example 2.3.

$$z_1 z_2 \in H_2$$

is neither z_1 nor z_2 regular. But take $z_1 = u_1 + u_2$, and $z_2 = u_2$, then

$$z_1 z_2 = (u_1 + u_2)u_2 = u_2^2 + u_1 u_2,$$

which is u_2 regular of order 2.

3 Some Algebra

In this section, we assume that R is a ring and $A, B, M_1, \dots, M_i, \dots$, are R -modules.

Definition 3.1. A R -module M is called Noetherian if one of the following equivalent conditions holds.

- i). Each submodule $N \subseteq M$ is finite (ie. finitely generated).
- ii). Each ascending sequence $M_0 \subsetneq N_1 \subsetneq \dots \subsetneq M$ stabilizes.
- iii). Each non-empty set of submodules contains a maximal element.

The ring R itself is Noetherian if R is Noetherian as a moduler over itself. (ie. ideals are finitely generated and so are other conditions hold for ideals).

Example 3.1. Fields are Noetherian. Principle ideal domains are Noetherian, in particular, \mathbb{Z} or $k[X]$ where k is a field are all Noetherian.

Theorem 3.1 (Hilbert Nullstellensatz). If R is Noetherian then so is $R[x]$. In particular for any $R[x_1, \dots, x_n]$ is Noetherian.

Theorem 3.2. Given an exact sequence in R -modules,

$$0 \longrightarrow M \longrightarrow N \longrightarrow P \longrightarrow 0$$

If any two of them are Noetherian so is the other one.

Theorem 3.3. Suppose R is Noetherian, and M is a R -module. M is Noetherian if and only if M is finite.

Definition 3.2. A ring R is local if it contains a unique maximal ideal \mathfrak{m} .

Example 3.2. H_n -s are local.

Theorem 3.4 (Krull's lemma). *Let (R, \mathfrak{m}) is a local Noetherian ring. Let M be a finite R -module with two submodules $M_1, M_2 \subseteq M$. Suppose that for each $l \in \mathbb{N}$,*

$$M_1 \subseteq M_2 + \mathfrak{m}^l M \Rightarrow M_1 \subseteq M_2.$$

In particular, $M = R$, we set $\mathfrak{a} = \bigcup_{k \geq 0} \mathfrak{m}^k$. We have,

$$\mathfrak{a} \subset (0) + \mathfrak{m}^l.$$

Thus $\mathfrak{a} = (0)$.

Corollary 3.1. *\mathcal{C}_0^∞ be the ring of germs of smooth function at 0 and $\mathfrak{m} = \{f \in \mathcal{C}_0^\infty \mid f(0) = 0\}$ be the ideal of germs at 0. Then*

$$\bigcup \mathfrak{m}^l \neq (0).$$

Therefore \mathcal{C}_0^∞ is not Noetherian.

We assume R to be an integral domain.

Definition 3.3. *An element $x \in R$ is irreducible if x is neither 0 nor a unit, and*

$$x = uv \Rightarrow u \text{ or } v \text{ is a unit..}$$

An element $p \in R$ is prime if

$$p|ab \Rightarrow p|a \vee p|b.$$

Remark 3.1. *Primes are irreducible.*

Definition 3.4. *A ring R is called factorial if for any $x \in R \setminus \{0\}$ is a product of primes.*

Proposition 3.1. *The following conditions are equivalent for a ring R .*

- i). R is factorial.
- ii). Each nonzero element $x \in R$ is a product of irreducibles which is unique up to ordering.
- iii). Each nonzero element is a product of irreducibles and all irreducibles are primes.

Example 3.3. $\mathbb{Z}, k[x]$ are factorial. The ring of Gauss integers $\mathbb{Z}[i]$ is factorial, it is in particular, a principal ideal domain.

Theorem 3.5 (Gauss). *If R is factorial then $R[x]$ is also factorial. The units of $R[x]$ are of those in R . The primes in $R[x]$ are*

- 1). the primes of R ,
- 2). the primes which are also primitive polynomials which are in $Q = \text{Frac}(R)$ (ie. the polynomial with coefficients in R and all of them are coprime.).

Proposition 3.2. Let k be a field and (A, \mathfrak{m}) be a local k -algebra.

$$k \longrightarrow A \longrightarrow A/\mathfrak{m}$$

$$a \longmapsto a \cdot 1_A \longmapsto \overline{a \cdot 1_A}$$

$$f \xrightarrow{\sigma} \bar{f}$$

This define $\rho : A \rightarrow k$ by sending $f \mapsto \bar{f}^{\sigma^{-1}} \in k$.

Definition 3.5. A is called hensel/hensilian if it satisfies the following conditions.

Let $f(t)$ be a monic polynomial in $A[t]$. Let $\omega(t) = \rho(f(t))$ where $\rho : A \rightarrow k$ which induces $\rho : A[t] \rightarrow k[t]$ by $t \mapsto t$ and $\omega(t) = \omega_1(t)\omega_2(t)$ where both of them are monic polynomial coprime to one another.

Then there are monic polynomials $f_1(t), f_2(t) \in A[t]$ with $f(t) = f_1(t)f_2(t)$, with

$$\rho(f_i(t)) = \omega_i(t).$$

Example 3.4. Valuation rings are Hensel.

4 Algebras of H_n

The typical case, we have,

$$H_1 = \mathbb{C}\{x\},$$

which is a principal ideal domain which is local with the unique maximal ring (z) and all non-trivial ideals are of the form. (z^k) for $k \in \mathbb{N}$.

Definition 4.1. Let

$$f = \sum_{j=0}^{\infty} f_j,$$

where f_j is a homogeneous polynomial of degree j . Then we define

$$o(f) = \min\{j \in \mathbb{N} \mid f_j \neq 0\}$$

Remark 4.1. We have the following properties.

$$i). \quad o(fg) = o(f) + o(g).$$

$$ii). \quad o(f) = 0 \Leftrightarrow f \text{ is a unit.}$$

Theorem 4.1. Let $\omega \in H_n[t]$ be monic of degree s . Let

$$\Omega(t) = \omega(0, t) \in \mathbb{C}[t].$$

Thus by the fundamental theorem of algebra, we have,

$$\Omega(t) = \prod_{i=1}^l (t - c_i)^{s_i},$$

where $s = \sum_{i=1}^l s_i$ and c_i -s are distinct.

Then there are monic polynomials $\omega_i(z, t) \in H_n[t]$ such that

$$\omega(0, t) = (t - c_i)^{s_i}, \quad \omega(z, t) = \prod_{i=1}^l \omega_i(z, t).$$

Furthermore, ω_i -s are unique.

Proof. We prove this by induction on l . For $l = 1$ is trivial as take $\omega_1(z, t) = \omega(z, t)$.

Suppose the statement holds for $l - 1$. If $\omega(0, 0) = 0$, then

$$\Omega(t) = t^{s_1} \tilde{\Omega}(t).$$

Then this decomposition tells us that $\omega(z, t) \in H_n[t] \subset H_{n+1}$ which is t -regular of order s_1 by Weierstrass Vorbereitungs satz. We get,

$$\omega = \omega_1 e.$$

We have,

$$e \in H_n[t], \quad o(e) = s - s_1.$$

$$\omega(z, t) = \omega_1(z, t)e(z, t).$$

Observe that,

$$e(0, t) = \tilde{\Omega}(t) = \prod_{i=2}^l (t - c_i)^{s_i}.$$

apply the induction hypothesis we get the dcomposition.

For the general case, let c_1 be such that $\omega(c_1, 0) = 0$. Then consider $\omega'(z, t) = \omega(z + c_1, t)$.

$$\prod_{i=1}^l \omega'_i(z, t) = \omega'(z, t).$$

Set $\omega_i(z, t) = \omega'_i(z - c_1, t)$. \square

Theorem 4.2. H_n is Noetherian, factorial and henselian.

Proof. Let $\mathfrak{a} \subseteq H_n$ be an ideal and $f \in \mathfrak{a}, f \neq 0$.

Consider $\sigma : H_n \xrightarrow{\sim} H_n$ an automorphism such that σf is z_n -regular of order k . Observe that $\sigma \mathfrak{a}$ is finite so is \mathfrak{a} .

Let $h \in H_n$, by Weierstrass division formula, we have,

$$h = qf + r,$$

where $r \in H_{n-1}[z_n]$ and $\deg r < k$. Write

$$r(z) = a_0 z_n^{k-1} + a_1 z_n^{k-1} + \cdots + a_{k-1},$$

where $a_k \in H_{n-1}$. Associate,

$$h \mapsto (a_0, \dots, a_{k-1}) \in H_{n-1}^k.$$

Then such map $H_n \rightarrow H_{n-1}^k$ is surjective with kernel (f) .

$$\begin{aligned} H_n \rightarrow A = H_n/(f) &\xrightarrow{\sim} H_{n-1}^k \\ \mathfrak{a} \mapsto \bar{\mathfrak{a}} &\xrightarrow{\sim} \{\text{finite submodule of } H_{n-1}\}. \end{aligned}$$

Suppose H_{n-1} is Noetherian then $\bar{\mathfrak{a}}$ is finite. So there are $f_1, \dots, f_l \in \mathfrak{a}$ such that

$$(\bar{f}_1, \dots, \bar{f}_l) = \bar{\mathfrak{a}}.$$

Therefore, we see

$$(f, f, \dots, f_l) = \mathfrak{a}.$$

For the factorial part, let $f \in H_n$.

If f is irreducible there is nothing to show.

If f is not irreducible then $f = f_1 f_2$ and by the definition, we can assume f_1, f_2 are not units. Therefore,

$$o(f_1), o(f_2) < o(f).$$

Thus by induction, we see f is a product of irreducible.

We have H_1 is factorial. Suppose the statement holds for $n - 1$, then for an irreducible $f \in H_n$, consider,

$$f | f_1 f_2,$$

we may assume the yare z_n -regular. By Weierstrass Vorbereitungs satz, we have

$$f = e\omega, f_1 = e_1\omega_1, f_2 = e_2\omega_2.$$

Since e, e_1, e_2 are all unit, in particular ω is irreducible. Thus if

$$\omega|\omega_1\omega_2 \Leftrightarrow \omega_1\omega_2 = e\omega,$$

for some $q \in H_n$. By the assumption we have $q \in H_{n-1}[z_n]$. This means that

$$\omega|\omega_1\omega_2$$

in $H_{n-1}[z_n]$. We have ω is prime in $H_{n-1}[z_n]$. Thus either $\omega|\omega_1$ or $\omega|\omega_2$. Using Theorem 3.5, we conclude $\omega|\omega_1$ or $\omega|\omega_2$ in H_n .

Finally for the Henselian part, let $\omega \in H_n[t]$, and consider

$$\rho : H_n \rightarrow \mathbb{C}, \rho(f) = f(0).$$

This induces

$$\rho(\omega(z, t)) = \omega(0, t) \in \mathbb{C}[t].$$

□

Definition 4.2. Let \mathcal{K} be the sheaf of meromorphic functions on \mathbb{C}^n . We define

$$\mathcal{K}_0 = K_n = \text{Frac}(H_n).$$

Remark 4.2. As we have seen H_n is factorial any element $m \in H_n$ can be expressed as $m = \frac{f}{g}$ where f, g are coprime.

Theorem 4.3. Let $f, g \in \mathcal{O}(U)$. Assume that at $z \in U$, f_z and g_z are coprime. Then there is a neighborhood V of z such that for all $\zeta \in V$ the germs f_ζ, g_ζ are coprime. Moreover let $a \in \hat{\mathbb{C}} = \mathbb{C} \cup \{\infty\}$ and let

$$m(z) = \frac{f(z)}{g(z)} \text{ on } V.$$

Then there is, for any neighborhood V' of z , a point $\zeta \in V'$ with $m(\zeta) = a$.

Proof. Without the loss of generality, we may assume that $z = 0$, and $f_0, g_0 \in H_n = \mathcal{O}_0$ which are z_n -regular. By Weierstrass Vorbereitungs satz, we have,

$$f_0 = e_0\omega_0, g_0 = \tilde{e}_0\tilde{\omega}_0.$$

By assumption $\omega_0, \tilde{\omega}_0$ are relatively prime in \mathcal{O}_0 . So f, g are monic polynomial in z_n which is a Weierstrass polynomial at 0.

Again using f_0, g_0 are relatively prime in $H_{n-1}[z_n]$. But this implies that f_0, g_0 are also relatively prime in $\mathcal{K}_{n-1}[z_n]$. Formally, there exists $A, B \in \mathcal{K}_{n-1}$ such that

$$Af + Bg = 1 \quad (\text{in } H_{n-1}[z_n]),$$

and multiply this by the common denominator, we get,

$$af + bg = c.$$

Note that a, b are holomorphic in 0 in \mathbb{C}^n . So $c = c(z')$.

In a neighborhood of the origin,

$$U = U_{z'} \times U_{z_n},$$

for $z \in U$.

$$a(z)f(z) + b(z)g(z) = c(z').$$

Let $\zeta = (\zeta', \zeta_n)$. Then f, g are $(z_n - \zeta_n)$ -regular of some order. And the same is true for all the common divisors of f and g . Thus by applying Weierstrass Vorbereitungs satz to $z_n - \zeta_n$, we obtained a Weierstrass polynomial in $z_n - \zeta_n$ which divide f, g simultaneously. On the other hand, we have the equation,

$$af + bg = c.$$

Consequently, the common divisor of f, g divides c . That is to say for a common divisor ω in (ζ', ζ) we have $\omega_\zeta | c_\zeta$.

But $\deg_{z_n, \zeta_n} c_\zeta = 0$, thus,

$$\deg_{z_n, \zeta_n} \omega_\zeta = 0.$$

In $z_n - \zeta_n$, we have $\omega = 1$, thus f_ζ, g_ζ are with no common divisors.

For the second part, we assume $h = 0$ and replace f by $f - hg$. Suppose f, g are Weierstrass polynomial at 0 such that

$$af + bg = c.$$

f has zeros for $|z_n|$ arbitrary small. Assume zeros of f are also zeros of g . Then for all z' we get

$$c(z') = 0.$$

This is a contradiction. Thus there must be a point in the neighborhood of the origin such that f is 0 but g is not. \square

Remark 4.3. f_z, g_z above are not units. We have,

$$m(z) = \frac{z_1}{z_2}.$$

Several cases to consider that the value $\frac{f_z}{g_z}$ takes poles, zeros, or indeterminants. The above case is a trivial example of it.

5 Analytic Sets

5.1 Basics

Definition 5.1. Let $U \subseteq \mathbb{C}^n$ be a domain. A subset $M \subseteq U$ is said to be locally analytic if for each point $x \in M$, there is a neighborhood $V = V(x)$ and finitely many functions $f_1, \dots, f_k \in \mathcal{O}(V)$ such that

$$M \cap V = \{z \mid i = 1, \dots, k, f_i(z) = 0\} = V(f_1, \dots, f_k).$$

M is called analytic if it is locally analytic and closed in U .

Definition 5.2. Let $U \subseteq \mathbb{C}^n$ be a domain. A subset $M \subseteq U$ is called a locally analytic submanifold if for any $z \in M$ there exists $W = W(z)$ a neighborhood and finitely many holomorphic functions $f_{k+1}, \dots, f_n \in \mathcal{O}(W)$ such that

$$M \cap W = V(f_{k+1}, \dots, f_n),$$

and the matrix

$$\left(\frac{\partial f_i}{\partial z_j} \right)_{\substack{i=k+1, \dots, n \\ j=1, \dots, n}},$$

has the highest rank possible.

M is called an analytic submanifold if it is locally analytic submanifold and closed.

Remark 5.1. Clearly, analytic submanifolds are also analytic sets. Also there are coordinates w_1, \dots, w_n such that

$$M \cap W = \{w \mid w_{k+1} = \dots = w_n = 0\}.$$

The above assertion follows from implicit function theorem.

Definition 5.3. Let M be an analytic submanifold. The dimension of M is k such that

$$M \cap W = \{w \mid w_{k+1} = \dots = w_n = 0\}.$$

Definition 5.4. Let M be an analytic set. A point $z \in M$ is called regular(or simple) if in a neighborhood of $W = W(z)$ of z , $M \cap W$ is also an analytic submanifold of W . The other points are called singular. The set of singular points is denoted by

$$S(M) = \{z \mid z \text{ is singular}\}.$$

Remark 5.2. $S(M)$ is closed.

Remark 5.3. Suppose $F : U \rightarrow U'$ be biholomorphic and $M \subset U$ be an analytic set then $F(M)$ is also analytic in U' .

Remark 5.4. Suppose in $\mathbb{C} = \mathbb{C}^1$, all the locally analytic sets are discrete points.

Remark 5.5. Let U be a domain, consider a holomorphic functions \mathcal{O} and take any subset $\mathcal{M} \subset \mathcal{O}(U)$. Let us define,

$$M := \{z \in \mathbb{C}^n \mid \forall f \in \mathcal{M}, f(z) = 0\} = V(\mathcal{M}),$$

then M is an analytic subset.

Example 5.1. Let $V(z_1 z_2) \in \mathbb{C}^2$. Then we get,

$$V(z_1 z_2) = \{z_1 = 0\} \cup \{z_2 = 0\}.$$

All the points are regular except for the origin.

Example 5.2. In \mathbb{C}^2 , the set $V(z_1^2 - z_2^3)$ contains only regular points except for the origin.

Consider the map,

$$\mathbb{C} \ni t \mapsto (t^2, t^3) \in \mathbb{C}^2.$$

This is continuous bijection, but not biholomorphic.

Proposition 5.1. Let $U \subset \mathbb{C}^n$ be domain. We have,

1). \emptyset, U are both analytic in U .

2). Arbitrary intersection and finite unions of analytic sets are analytics.

Proof. Clearly, $\emptyset = V(1), U = V(0)$. For the second part, suppose we have,

$$A = V(f_1, \dots, f_n), B = V(g_1, \dots, g_m).$$

Then we have,

$$A \cap B = V(f_1, \dots, f_n, g_1, \dots, g_m), A \cup B = V(f_i g_j)_{\substack{i=1, \dots, n \\ j=1, \dots, m}}.$$

□

Remark 5.6. For a proper analytic subset A of a domain U , we have $A^\circ = \emptyset$.

Proposition 5.2 (Riemann First Extension Theorem). Let U be a domain and $A \subsetneq U$ be analytic. Suppose $f \in \mathcal{O}(U \setminus A)$ is locally bounded on U , then f extends to U .

Proof. We may assume that at z_0 , A is given by $A = V(g)$ for a single holomorphic function g on $W(z_0)$. Assume after change of coordinates by Weierstrass Vorbereitungsatz, we assume g is a Weierstrass polynomial in 0.

Write $f = f(z', z)$ where z' is fixed, then f is holomorphic in z_n . The extension is given by

$$f(z', z_n) = \frac{1}{2\pi} \int_{\text{boundary of the ball around the critical points}} \frac{f(z', \zeta_n)}{(\zeta - n - z_n)} d\zeta_n.$$

This is holomorphic in (z', z_n) . This tells us that f can be extended. □

Remark 5.7. If U is a domain and $A \subsetneq U$ is an analytic set then $U \setminus A$ is connected. $U \setminus A$ is not connected, then there exists two open sets U_1, U_2 such that $U_1 \cap U_2 = \emptyset$ and $U_1 \cup U_2 = U \setminus A$.

$$f(z) = \begin{cases} 1 & (\text{on } U_1), \\ 0 & (\text{on } U_2). \end{cases}$$

Remark 5.8. There are no isolated singularities in \mathbb{C}^n for $n > 1$. Suppose f has an isolated 0 and f is holomorphic on $\overline{U} \setminus \{0\}$ and consider a line l , passing through some point z in U but does not contain 0. Then f is bounded on $l \cap \partial U$. In particular, f is bounded by z in its maximum $|f|_{\partial U}$.

5.2 Some More Algebras and Topologies

Definition 5.5. Let K be a field of characteristic 0 and \bar{K} be its algebraic closure. Consider a monic polynomial $f(t) \in K[t]$ such that

$$f(t) = t^k + a_1 t^{k-1} + \cdots + a_k.$$

Then f has k -many zeros t_1, \dots, t_k allowing multiplicity. The discriminant of f is

$$D_f = \prod_{j < k} (t_j - t_k)^2.$$

Remark 5.9. $D_f \in \mathbb{Z}[a_1, \dots, a_k] \subset K$ and $D_f = 0$ if and only if it contains a multiple roots.

Definition 5.6. Let

$$f(t) = \sum_{i=0}^n a_i t^{n-i}, g(t) = \sum_{i=0}^m b_i t^{m-i}.$$

Then we define

$$R(f, g) = \det \begin{pmatrix} a_0 & a_1 & \cdots & a_n & 0 & \cdot & 0 \\ 0 & a_0 & \cdots & a_{n-1} & a_n & \cdots & 0 \\ \vdots & \ddots & \vdots & a_0 & \cdots & a_n & \\ b_0 & b_1 & \cdots & b_m & 0 & \cdot & 0 \\ 0 & b_0 & \cdots & b_{m-1} & b_m & \cdots & 0 \\ \vdots & \ddots & \vdots & b_0 & \cdots & b_m & \end{pmatrix}$$

which is a determinant of $(n+m)(n+m)$ times matrix where we placed a_0, \dots, a_n m -many times and b_0, \dots, b_n n -many times. We call this the resultant of f, g . and this belongs to $\mathbb{Z}[a_0, \dots, a_n, b_0, \dots, b_m]$.

Proposition 5.3. Let

$$f(t) = \sum_{i=0}^n a_i t^{n-i}, g(t) = \sum_{i=0}^m b_i t^{m-i}.$$

such that $a_0 b_0 \neq 0$. Then $R(f, g) = 0$ if and only if f, g have common divisors.

Proposition 5.4. Let $f(t) = t^m + a_1 t^{m-1} + \cdots$, then we have,

$$D_f = R(f, f').$$

Proposition 5.5. Suppose R is a factorial ring and $\omega \in R[t]$, such that

$$\omega = \omega_1 \cdots \omega^l,$$

be its prime decomposition. We have $D_\omega = 0$ if and only if there are prime appearing multiple times in ω .

Proof. Let $D_\omega = 0$ for $\omega \in R[t]$. Then ω, ω' have a common prime. Suppose that

$$\omega' = \prod_{i=1}^n \omega'_i \prod_{j \neq i} \omega_j.$$

□

Definition 5.7. Let X, Y be connected, locally path connected Hausdorff spaces. Consider a continuous map $p : X \rightarrow Y$ is called an unbranched unlimited covering if for all $y \in Y$ there exists a neighborhood $V = V(y)$ such that

$$p^{-1}(V) = \coprod_{i \in \mathbb{N}} U_i,$$

where U_i -s are pairwise disjoint and $p|_{U_i} \cong V$.

$p : X \rightarrow Y$ a continuous map is called a covering if it is discrete (each fiber is discrete) and open in the discrete topology, $p^{-1}(\{y\})$ is an isolated points. We call the cardinality of $p^{-1}(\{y\})$ the number of sheets.

Example 5.3.

$$\mathbb{C} \rightarrow \mathbb{C}, z \mapsto z^2,$$

as well as

$$\mathbb{C}^\times \rightarrow \mathbb{C}^\times, z \mapsto z^2.$$

Definition 5.8. Let $f : X \rightarrow Y$ be a continuous function of locally compact spaces. We say,

1. f is proper if for any compact set $K \subseteq Y$, $f^{-1}(K)$ is compact.
2. f is finite if it is proper and discrete.

5.3 Analytic Hypersurfaces

Lemma 5.1. Let $U \subseteq \mathbb{C}^n$ be a domain. Consider a polynomial

$$f(z, t) = t^k + a_1(z)t^{k-1} + \cdots + a_k(z).$$

where a_i is holomorphic in U for each i . Suppose there is c such that $f(c, t)$ has k -distinct zeros in \mathbb{C} .

Then there is a neighborhood of c , W and holomorphic functions q_1, \dots, q_k on W such that

$$f(z, t) = \prod_{i=1, \dots, k} (t - q_i(z)).$$

In particular $q_i(c) = \alpha_x$.

Proof. Suppose $c = 0$ and $f_0 \in \mathcal{O}_0 = H_{n+1}$, (ie the coefficients of f are in H_n). We have,

$$f_0 = \prod_{i=1}^k (t - \alpha_x).$$

Since H_n is henselian, there exists germs $f_1, \dots, f_k \in H_n[t]$ such that $f_i(0, t) = t - \alpha_{x,i}$ thus set $f_x = t - q_x$ for $q_x \in H_n$. Choose a neighborhood $0 \in W$, such that all the germs are given by holomorphic functions. Then $q_x : W \rightarrow \mathbb{C}$ with

$$f(z, t) = \prod_i (t - q_i(z)). \quad (11)$$

□

Lemma 5.2. Let $f(t) = t^k + a_1 t^{k-1} + \dots \in \mathbb{C}[t]$. Suppose f has zeros $\alpha_1, \dots, \alpha_l \in \mathbb{C}$ with multiplicities r_1, \dots, r_l . Then for any $\varepsilon > 0$, there is $\delta > 0$ such that

$$D_\lambda = D_\varepsilon(x_\lambda), D_\delta(a) \quad (12)$$

where, $a = (a_1, \dots, a_k) \in \mathbb{C}^k$. Then if $b = (b_1, \dots, b_k) \in D_\delta$ then the map,

$$g(t) = t^k + b_1 t^{k-1} + \dots, \quad (13)$$

then g has exactly r_λ zeros in D_λ .

Proof. Let

$$F(z, t) = t^k + z_1 t^{k-1} + \dots, \quad (14)$$

holomorphic on $\mathbb{C}^k \times \mathbb{C}$. Consider,

$$X = V(F) \subseteq \mathbb{C}^{k+1} = \{F(z, t) = 0\}.$$

For $a \in \mathbb{C}^k$, we have,

$$\bigcup_{i=1}^l a \times \partial D_\lambda \cap X = \emptyset.$$

Then there exists $D_\delta(a)$ such that

$$\bigcup_{i=1}^l D_\delta(a) \times \partial D_\lambda \cap X = 0.$$

For $b \in D_\delta(a)$, adn $g(t) = F(b, t)$. Then the number of zeros of g in D_λ

$$= \frac{1}{2\pi i} \int_{\partial D_\lambda} \frac{g'(b; t)}{g(b; t)} dt,$$

which is continuous in b . Thus this is constant and we can take $b = a$ and the above quantity equals to r_λ . □

Lemma 5.3. Let $f(z, t) = t^k + a_1(z)t^{k-1} + \dots$ on $U \times \mathbb{C}$ where $U \subseteq \mathbb{C}^k$ open. Let $X = V(f) = \{f = 0\}$. Suppose $p : U \times \mathbb{C} \rightarrow U$ be a natural projection and $\pi = p|_X : X \rightarrow U$. We have,

- 1). π is discrete (ie. the fibers are discrete).
- 2). π is proper.

Proof. The first assertion is clear. For the second part, consider a compact subset $K \subseteq U$. Then each a_1, \dots, a_k are bounded on K . The previous lemma says that for $z \in K$, the zeros of $f(z, t)$ is bounded by C which is independent of z . We have,

$$\pi^{-1}(K) = V(f) \cap (K \times \{t \mid |t| \leq C\}), \quad (15)$$

which is clearly a compact set in $X = V(f)$. \square

Definition 5.9. Let X be an analytic set of a domain $U \subseteq \mathbb{C}^n$. X is called an analytic hypersurface if for all $x \in X$, there is a neighborhood $W(x)$ and $f \in \mathcal{O}(W)$ such that $X \cap W = V(f)$.

Remark 5.10. In the definition above, if $0 \in W$ and $f \in \mathcal{O}(W)$ which is z_n -regular at 0. By Weierstrass Vorbereitungs satz, we have,

$$f = e\omega,$$

where ω is a Weierstrass polynomial at 0. So choose W small enough that all the germs are given on W by holomorphic function, e has zeros. Thus $X \cap W = V(\omega)$.

Proposition 5.6. A hypersurface can locally be defined on $V(\omega)$ where ω is a polynomial in z_n Weierstrass polynomial at

Proof. Without the loss of generality, we may assume that ω is

Theorem 5.1. Let $f \in H_n[t]$ be monomial with no multiple prime factors. $\deg(f) = k$, suppose $f \in \mathcal{O}(U)$. The discriminant $\mathcal{O}(U) \ni D_f \neq 0$.

Set

$$X = V(f) \subseteq U \times \mathbb{C}, S = V(D_f) \subset U, U' = U \setminus S.$$

Furthermore, let

$$p : U \times \mathbb{C} \rightarrow U, \pi = p|_X, X' = X \setminus \pi^{-1}(S) = \pi^{-1}(U).$$

Then we have the following statements.

1. $X' \xrightarrow{\pi} U'$ unlimited unbranched covering with k -sheets.
2. $X \xrightarrow{\pi} U$ covering.
3. X' is locally the graph of a holomorphic function.

4. X' connected if and only if f is irreducible in $\mathcal{O}(U)^\circ[t]$ where X' is locally a graph of f .

Proof. Clearly π is discrete and open. Take $(z_0, t_0) \in U \times \mathbb{C}$ such that $f(z_0, t_0) = 0$. Let W be a neighborhood of (z_0, t_0) . Choose ε, δ from the previous lemma such that for $z \in D_\delta(z_0)$ there exists at least one zero of $f(z, f)$. Still $D_\delta(t_0), D_\delta \times D_\varepsilon \subseteq W$, and

$$\pi(W) \supseteq U.$$

Assume that X' is not connected. That is to say $X' = X'_1 \cup X'_2$ for disjoint open sets X'_1, X'_2 . Take $z_0 \in U'$. Then we know that

$$\begin{aligned} f(z, t) &= \prod_{i=1, \dots, k} (t - \varphi_i(z)), \text{ holomorphic close to } z_0, \\ &= \prod_{i=1, \dots, k_1} (t - \varphi_i(z)) \prod_{i=k_1+1, \dots, k} (t - \varphi_i(z)), \\ &= f_1(z, t) f_2(z, t), \text{ close to } z_0. \end{aligned}$$

Note that $\varphi_i(z)$ is holomorphically continued to all of U' . We obtain,

$$f(z, t) = (t^{k_1} + a_1^1(z)t^{k_1-1} \dots)(t^{k_2} + a_2^1(z)t^{k_2-1} \dots)$$

where a_i^j are elementary symmetric functions of $\{\varphi_i\}_{i=1, \dots, k_1}$ or $\{\varphi_i\}_{i=k_1+1, \dots, k}$, respectively with degree i . In particular, they are holomorphic on U' . By Riemann-extension theorem, we obtain that $a_i^j(z)$ for $j = 1, 2$ extends to a holomorphic function on U . We have that

$$f(z, t) = f_1(z, t) f_2(z, t).$$

For the other direction. Suppose f is not irreducible that is $f(z, t) = f_1(z, t) f_2(z, t) \in \mathcal{O}(U)[t]$. Then

$$X' = V(f) = V(f_1) \cup V(f_2),$$

which is a disjoint union. \square

Remark 5.11. The set S is considered as the set of points which are not regular, for example intersections of some curves.

Remark 5.12. All points in X' are regular. But there are also regular points in $X \setminus X' = \pi^{-1}(S)$.

For the second part, $\pi : X \rightarrow U$ covering then $\pi|_{X'} : X' \rightarrow U'$ proper by the previous lemma and is locally homeomorphic. Thus it is an unlimited unbranched covering. Again by the lemma, at a point $(z_0, t_0) \in X'$, we have X' is given by the local holomorphic function $t = q_x(z)$ notation from the lemma.

Remark 5.13. Let X_{reg} be the set of regular points. Then $X' \subseteq X_{\text{reg}} \subset X$. May of course happen that $X_{\text{reg}} \neq X'$.

6 Functions on Analytic Sets

In this section, $X \subseteq \mathbb{C}^n$ is used to denote some analytic set, and $X_{\text{reg}} \subseteq X$ the set of regular points of X .

Definition 6.1. A function $f : X \rightarrow \mathbb{C}$ is called holomorphic at a point $z_0 \in X$ if there is a neighborhood $U = U(z_0) \subseteq \mathbb{C}^n$ and $F : U \rightarrow \mathbb{C}$ such that

$$F|_{U \cap X} = f.$$

In particular, it is called holomorphic if it is holomorphic at all points of X .

A function $f : X \rightarrow \mathbb{C}$ is weakly holomorphic, if it is continuous and holomorphic at all regular points.

A function $f : X_{\text{reg}} \rightarrow \mathbb{C}$ is normal if f is holomorphic and locally bounded on X .

Remark 6.1. We have the following implications,

$$f \text{ is holomorphic} \Rightarrow f \text{ is weakly holomorphic} \Rightarrow f \text{ is normal.}$$

They are all equivalent if all points of X are regular.

Example 6.1. Let $X \subseteq \mathbb{C}^2$ such that $X = V(z^3 - w^2)$.

$$\mathbb{C} \ni t \xrightarrow{\varphi \text{ holomorphic}} (t^2, t^3) \in X \subseteq \mathbb{C}^2.$$

Observe that φ is a homeomorphism. Set $t = \sqrt{z}$, we get

$$\varphi(\pm t) = (z, w).$$

Consider $\varphi^{-1} : X \rightarrow \mathbb{C}$. φ^{-1} is continuous and holomorphic outside of the origin. Therefore, this is weakly holomorphic function. However, this is not holomorphic at the origin.

Suppose there is $h(z, w)$ in $U(0)$ such that

$$h|_X = \varphi^{-1}.$$

In other words,

$$(h|_X) \circ \varphi = \varphi^{-1} \circ \varphi.$$

We have,

$$h(t^2, t^3) = t.$$

Observe that $h(t^2, t^3)$ has 0 of order at least 2, but the right hand side shows that it has 0 of order 1.

Proposition 6.1. Suppose X is an analytic set without singular points contained in a domain $U \subseteq \mathbb{C}^n$. X is a analytic submanifold of dimension $k \leq n$. That is to say, local properties of holomorphic functions on \mathbb{C}^k are true for holomorphic functions on X . For example, identity theorem, maximum principle.

Proposition 6.2. Let X be an analytic set such that X_{reg} is connected and dense in X . If f is weakly holomorphic on X and is identically 0 on some non-empty open subset U of X , then f is identically 0 on X .

Proof. Since $U \cap X_{\text{reg}}$ is a non-empty open set. Thus $f \equiv 0$ on $U \cap X_{\text{reg}}$. By Proposition 6.1, $f \equiv 0$ on X_{reg} . By the continuity of f , $f \equiv 0$ on X . \square

Example 6.2. Let $X = V(z_1 z_2) \subseteq \mathbb{C}^2$. The origin is the only singular point in X . Consider $f(z_1, z_2) = z_1$. However, this doesn't mean f is everywhere 0 on X . This shows that the condition of connectedness in the proposition above is essential

Example 6.3. Let $X = V(z_1 z_2) \subseteq \mathbb{C}^2$. Consider,

$$f = \begin{cases} 1 & z_1 = 0, \\ 0 & z_2 = 0. \end{cases}$$

This function cannot be continued to the origin not even continuously. We see that Riemann extension theorem does not hold in this case.

Theorem 6.1. Let X be a hypersurface containing the origin and consider

$$X = \{(z, t) \mid w(z, t) = 0\},$$

where

$$w(z, t) = t^k + a_1(z)t^{k-1} \dots,$$

which is defined on $D^m \times D$. Let f be a normal function on X . Then there are holomorphic functions

$$a_1(z), \dots, a_k(z),$$

on D such that for all $z \in X_{\text{reg}}$,

$$f(z)^k + a_1(z)f(z)^{k-1} + \dots + a_k(z) \equiv 0.$$

Proof. Let Δ be the discriminant of w and $S = V(\Delta)$. Set $X' = \pi^{-1}(D \setminus S)$ where $\pi(z, t) = z$.

$$X' \xrightarrow{\pi} D' = D \setminus S,$$

is an unlimited unbranched cover. Let $z \in D'$, and $V(z) = V$ be a neighborhood. We have,

$$\pi^{-1}(V) = U_1 \cup \dots \cup U_k,$$

which is a disjoint union. Consider,

$$\pi|_{U_i} : U_i \xrightarrow{\sim} V,$$

which is biholomorphic. Note that

$$U_i = \{(z, t_i) \mid t_i \text{ is a zero of } \omega(z, t)\}.$$

Also we have,

$$U_i = \{(z, \varphi_i(z))\},$$

for some $\varphi_i \in \mathcal{O}(V)$ defined on V . We set,

$$f_i(z) = f(z, \varphi_i(z)).$$

We see,

$$\prod_{i=1, \dots, k} (f(z, t) - f_i(z)) = 0,$$

on V . On the other hand, this is equal to

$$= f(z, t)^k + a_1(z) f f(z, t)^{k-1} + \dots$$

where a_1, \dots are defined in all of D . \square

Remark 6.2. *The above theorem tells that there exists an integer algebraic equation for f . we have,*

Theorem 6.2 (Maximal principle). *Let X be a hypersurface and X_{reg} connected. For a weakly holomorphic function f , if it is bounded then it is constant.*

Proof. Suppose $0 \in X$, and pick a coordinate such that $f(0)$ is real and greater than 0 (ie. multiplying by $e^{i\theta}$). We know there is such a_1, \dots that,

$$f^k + a_1 f^{k-1} \dots = 0.$$

Previously we have seen that each a_i can be given by a symmetric functions of $f(z, t_i)$. In particular, we have,

$$\pm a_1 = \sum_{i=1}^k f(z, t_i).$$

Thus we have,

$$a_1(0) = k f(0).$$

Recall that $|f(z, t_i)| \leq f(0)$. a_1 has an absolute maximum? at 0, thus

$$a_1 \equiv k f(0).$$

In particular,

$$k f(0) = a_1(z) = \sum f(z, t_i) \leq \sum |f(z, t_i)| \leq k f(0).$$

Thus we have,

$$\sum |f(z, t_i)| = k f(0) \Rightarrow |f(z, t_i)| = f(0).$$

Furthermore,

$$\sum f(z, t_i) = \sum |f(z, t_i)| \Rightarrow f(z, t_i) = |f(z, t_i)| = f(0).$$

This tells us that close to the origin the functions $f(z, t_i)$ are constant. By the identity, we get,

$$f \equiv f(0).$$

□

7 More Algebras

Let R be a commutative ring with a unit.

Definition 7.1. An ideal $\mathfrak{q} \subset R$ is primary if $fg \in \mathfrak{q}$ and $g \notin \mathfrak{q}$ then $f^l \in \mathfrak{q}$ for some power $l \in \mathbb{N}$.

Definition 7.2. Let $\mathfrak{a}, \mathfrak{b} \subseteq R$ be ideals we define,

$$(\mathfrak{a} : \mathfrak{b}) = \{f \in R \mid f\mathfrak{b} \subseteq \mathfrak{a}\}.$$

Definition 7.3. Let M be a R -module. We define,

$$\text{Ann}(M) = \{f \in R \mid fM = 0\}.$$

Definition 7.4. An ideal $\mathfrak{a} \subseteq R$ is irreducible if for any ideals $\mathfrak{b}, \mathfrak{c} \subseteq R$, we have,

$$\mathfrak{a} = \mathfrak{b} \cap \mathfrak{c} \Rightarrow \mathfrak{a} = \mathfrak{b} \text{ or } \mathfrak{a} = \mathfrak{c}.$$

Remark 7.1. Prime ideals are both primary and irreducible.

Remark 7.2.

$$\sqrt{\sqrt{\mathfrak{a}}} = \sqrt{\mathfrak{a}}.$$

We also have,

$$\sqrt{\mathfrak{a} \cap \mathfrak{b}} = \sqrt{\mathfrak{a}} \cap \sqrt{\mathfrak{b}}$$

Remark 7.3. It is an exercise to show that,

$$\sqrt{\mathfrak{a}} = \bigcap_{\mathfrak{p} \in \text{Spec}(R/\mathfrak{a})} \mathfrak{p}.$$

and

\mathfrak{q} is primary then there is $\mathfrak{p} \in \text{Spec}(R)$ such that $\sqrt{\mathfrak{q}} = \mathfrak{p}$.

Corollary 7.1.

$$\sqrt{(0)} = \bigcup_{\mathfrak{p} \in \text{Spec } R} \mathfrak{p}.$$

Proof. Follows directly from Remark 7.3. \square

Definition 7.5. A ring is reduced if $\sqrt{(0)} = (0)$.

Lemma 7.1 (Primary Decomposition). Let R be Noetherian. An ideal is primary if and only if it is irreducible. Furthermore, every ideal is finite intersection of primary ideals.

Proof. Exercise. \square

Definition 7.6. Let R be Noetherian and $\mathfrak{a} \subset R$ be an ideal. The primary decomposition,

$$\mathfrak{a} = \bigcap_{i=1, \dots, k} \mathfrak{q}_i,$$

is irredundant if all the \mathfrak{q}_i are different.

Theorem 7.1 (Lasker-Noether). Let R be Noetherian and $\mathfrak{a} \subset R$ be an ideal. \mathfrak{a} admits an irredundant representation if,

$$\mathfrak{a} = \bigcap_{i=1, \dots, k} \mathfrak{q}_i.$$

Furthermore, the number of primary ideals k is uniquely determined and so is the radicals \mathfrak{p}_i of \mathfrak{q}_i which are uniquely determined.

If \mathfrak{p} is a prime ideal containing \mathfrak{a} and it is minimal with respect to inclusion. Then the radials of \mathfrak{q}_i is \mathfrak{p}_i for some i and

If $\mathfrak{a} = \sqrt{\mathfrak{a}}$, then

$$\mathfrak{a} = \bigcap_{\substack{i=1, \dots, k \\ \mathfrak{p}_i \in \text{Spec}(R)}} \mathfrak{p}_i,$$

where \mathfrak{p}_i -s are minimal ideals containing \mathfrak{a}

Definition 7.7. Consider the primary decomposition of $\mathfrak{a} \subseteq R$ where R is Noetherian. Each \mathfrak{p}_i of the decomposition is called the primary component of \mathfrak{a} . The minimal ones among such primary ideals are called either minimal/isolated. Otherwise they are called embedded.

8 Analytic germs

Definition 8.1. Let X be topological space and $A, B \subset X$ and $a \in X$. We say,

$$A \sim_a B$$

if there exists a neighborhood of a , $U = U(a)$, $U \cap A = U \cap B$. We denote a class of this equivalence relation by A_a or B_a .

Definition 8.2. An analytic germ at $a \in \mathbb{C}^n$ is a germ at a of an analytic set X . Thus we write X_a for such germ.

Lemma 8.1. *Union, intersection, and inclusion of analytic germs are defined. Furthermore, finite unions/intersections of analytic germs are again analytic.*

Definition 8.3. *Let $a \in \mathbb{C}^n$ and consider germs at \mathcal{O}_a . We define,*

$$\mathfrak{a} = (f_1, \dots, f_n) \subset \mathcal{O}_a,$$

an ideal generated by f_1, \dots, f_n . such that f_i converges at $U(a)$ for all $i = 1, \dots, k$. Then we define,

$$V(\mathfrak{a}) = \{x \in \mathbb{C}^n \mid \forall i = 1, \dots, k, f_i(x) = 0\}_a,$$

which is a germ associated with a .

Lemma 8.2. *$V(\mathfrak{a})$ only depends on \mathfrak{a} .*

Definition 8.4. *Let X_a be an analytic germ at a represented by an analytic set $X \subseteq U(a)$ and $f \in \mathcal{O}_a$ given by holomorphic function on $U(a)$. We have,*

$$f|_{X_a} = 0 \Leftrightarrow f \equiv 0 \text{ on } X \cap U(a).$$

We define,

$$J(X_a) = \{f \in \mathcal{O}_a \mid f \text{ vanishes on } X_a\}.$$

So $J(X_a)$ is an ideal in \mathcal{O}_a .

Remark 8.1. *We want to show what relation we have with,*

$$\begin{aligned} \mathfrak{a} &\mapsto V(\mathfrak{a}), \\ J(X) &\leftrightarrow X. \end{aligned}$$

Proposition 8.1. *For any analytic sets X, Y , we have,*

$$VJ(X) = X.$$

Furthermore,

$$\begin{aligned} X \subseteq Y &\Leftrightarrow J(X) \supseteq J(Y), \\ J(X \cap Y) &= J(X) + J(Y), \\ J(X \cup Y) &= J(X) \cap J(Y). \end{aligned}$$

And for any ideal \mathfrak{a} , we have,

$$JV(\mathfrak{a}) = \sqrt{\mathfrak{a}}.$$

Furthermore, if $\mathfrak{a}, \mathfrak{b} \subset R$, we have,

$$\begin{aligned} \mathfrak{a} \subseteq \mathfrak{b} &\Leftrightarrow V(\mathfrak{a}) \supseteq V(\mathfrak{b}), \\ V(\mathfrak{a} \cap \mathfrak{b}) &= V(\mathfrak{a}\underline{\mathfrak{b}}) = V(\mathfrak{a}) \cup V(\mathfrak{b}), \\ V(\mathfrak{a}, \mathfrak{b}) &= V(\mathfrak{a}) \cap V(\underline{\mathfrak{b}}). \end{aligned}$$

Proposition 8.2. Consider a descending sequence of germs

$$X_1 \supseteq X_2 \supseteq \cdots,$$

Then this stabilizes at finitely many steps.

Proof. Look at the ideals and use that \mathbb{C} is a field thus $\mathbb{C}[x]$ is Noetherian. \square

Definition 8.5. Let X be irreducible then there is no analytic sets Y, Z which are proper subsets of X such that $X = Y \cup Z$.

Proposition 8.3. X is irreducible if and only if $J(X)$ is prime.

Proof. Suppose $J(X)$ is not prime then, there are $f, g \in \mathcal{O}_a$ with $fg \in J(X)$, such that $f, g \notin J(X)$. Then we have,

$$V(f) \cup V(g) = V(fg) \supseteq X. \quad (16)$$

Thus we have $X = (V(f) \cap X) \cup (V(g) \cap X)$ which neither of the factors are equal to X . Thus X is not irreducible.

The question is if \mathfrak{p} is prime then is $V(\mathfrak{p})$ irreducible? We have,

$$JV(\mathfrak{p}) \supset \mathfrak{p}.$$

Recall Hilbert/Rückert Nullstellensatz,

$$JV(\mathfrak{p}) = \mathfrak{p}.$$

Accordingly, we have,

$$JV(\mathfrak{a}) = \sqrt{\mathfrak{a}}.$$

\square

Definition 8.6. We say,

$$X = \bigcup_{i=1, \dots, k} X_i,$$

is irredundant if no X_i can be skipped.

Theorem 8.1. Every analytic germs is the irredundant union of finitely many prime germs

$$X = \bigcup_{i=1, \dots, k} X_i,$$

where each X_i is uniquely determined by X .

Proof. Let \mathfrak{M} be the set of germs which is not-empty and \mathfrak{I} be the corresponding ideals. Since $\mathbb{C}[x]$ is Noetherian, we have, \mathfrak{I} has a maximal element. Thus \mathfrak{M} has a minimal element.

Consider $\mathfrak{M} = \{X \text{ where the statement fails}\}$. Then by the argument above, there is a minimal element X^0 of \mathfrak{M} . Since X^0 is redundant we have $X^0 = X^1 \cup X^2$ where X^1, X^2 satisfies the statement. Then we can take X_i^0 so that X^0 also satisfies the statement.

The uniqueness follows from Lasker-Noether theorem. Indeed, we have,

$$X = X_1 \cup \cdots \cup X_r,$$

then consider

$$\mathfrak{a} = J(X) = J(X_1) \cap \cdots \cap J(X_r) = \mathfrak{p}_1 \cap \cdots \cap \mathfrak{p}_r.$$

□

Example 8.1. Let X be an analytic set on $U \subseteq \mathbb{C}$. Consider a germ X_a at $a \in X$. We have,

$$\mathcal{O}_a/J(X_a) = \mathcal{O}(X)_a.$$

We say $\mathcal{O}(X)_a$ is the associated ring of holomorphic germs on X .

Example 8.2. $X_1 = V(z_3) \subseteq \mathbb{C}^3$ and $X_2 = V(z_1 z_2) \subseteq \mathbb{C}^3$.

Example 8.3. Consider $X = V(\underbrace{z^2 - uw^2}_{=f}) \subseteq \mathbb{C}^3$. Then f is irreducible but at $a = (0, 0, a_3 \neq 0)$ then $f = (z + w\sqrt{u})(z - w\sqrt{u})$. We see that X_0 is prime but X_a is not.

9 Convexity

9.1 Holomorphic convexity

Definition 9.1. Let $\mathcal{G} \subseteq \mathbb{C}^n$ be a domain. An extension pair is a tuple (U, V) of open sets such that U is non-empty and V is connected not equal to \mathcal{G} satisfying,

$$U \subseteq \mathcal{G} \cap V.$$

Definition 9.2. Let $f\mathcal{O}(\mathcal{G})$. An extension of f is a triplet (U, V, F)

- i). (U, V) is an extension pairing,
- ii). $F \in \mathcal{O}(V)$,
- iii). $F|_U \equiv f|_U$.

Definition 9.3. A domain $\mathcal{G} \subseteq \mathbb{C}^n$ is called a domain of holomorphy if each extension pair (U, V) there is a holomorphic functions $f \in \mathcal{O}(\mathcal{G})$, such that f cannot be extended to (U, V) .

Definition 9.4. A domain $\mathcal{G} \subseteq \mathbb{C}^n$ is called a domain of existence if there is a holomorphic function $f \in \mathcal{O}(\mathcal{G})$ which is not extendable by any extension.

Remark 9.1. Clearly a domain of existence is a domain of holomorphy but the converse is not necessarily true.

Definition 9.5. Let f be a function defined on M , we set,

$$|f|_M := \max\{|f(x)| \mid x \in M\}.$$

Definition 9.6. Let $K \subseteq \mathcal{G}$ be a compact set. The holomorphic convex hull of K is

$$\hat{K} = \{z \in \mathcal{G} \mid \forall f \in \mathcal{O}(\mathcal{G}), |f(z)| \leq |f|_K\}.$$

In particular, the domain \mathcal{G} is holomorphically convex if \hat{K} is compact for all compact sets $K \subseteq \mathcal{G}$.

Example 9.1. For dimension 1, all domains are domains of holomorphy. Consider a domain \mathcal{G} , and $z_0 \in \partial\mathcal{G}$. Then the function,

$$z \mapsto \frac{1}{z - z_0}$$

cannot be extended beyond the boundary.

Remark 9.2. For $n \geq 1$, convex domains are domains of holomorphy and holomorphically convex.

Proposition 9.1. Products of domains of holomorphy/holomorphically convex sets are again domains of holomorphy/holomorphically convex, respectively. In particular, disks and balls, (disks are products of one dimensional domains and disks and balls are convex).

Remark 9.3. Let \mathcal{G} be a domain and $K \subseteq \mathcal{G}$ be a compact set then $\mathcal{G} \setminus K$ is never a domain of holomorphy nor holomorphically convex.

Let \mathcal{G} be a domain and $z \in \mathcal{G}$. We define,

$$\delta(z) = \max\{r > 0 \mid D_r(z) \subseteq \mathcal{G}\}.$$

We call $\delta(z)$ the holomorphic distance of z .

Furthermore, let $K \subseteq \mathcal{G}$ be compact, we set,

$$\delta(K) = \min\{\delta(z) \mid z \in K\}.$$

Finally, we define, for $0 < \rho < r = \delta(K)$,

$$K_\rho = \bigcup_{z \in K} D_\rho(z).$$

Remark 9.4. δ is continuous and strictly positive or everywhere ∞ . In particular, $\delta(K) > 0$ for any compact $K \subseteq \mathcal{G}$.

Theorem 9.1 (Cartan/Thullen). Let \mathcal{G} be a domain and K be a compact subset of \mathcal{G} . Take $z_0 \in \hat{K}$. If u is a holomorphic function on \mathcal{G} , then set $p_{u,z_0}(z)$ as the power series of u around z_0 . Then $p_{u,z_0}(z)$ converges on $D_{\delta(K)}(z_0)$.

Proof. By assumption, we have,

$$p_{u,z_0}(z) = \sum_{\alpha \in \mathbb{N}^n} a_\alpha (z - z_0)^\alpha,$$

where a_α is given by,

$$a_\alpha = \frac{1}{\alpha!} D^\alpha u(z_0).$$

We have,

$$D^\alpha u(z) = \frac{\alpha!}{(2\pi i)^\alpha} \int_{|\zeta_1 - z_1|=\rho} \cdots \int_{|\zeta_n - z_n|=\rho} \frac{u(\zeta)}{(\bar{\zeta} - \bar{z})^{\alpha+(1,\dots,1)}} d\zeta$$

Taking the modulo, we have,

$$|D^\alpha u(z)| \leq \alpha! \left(\frac{1}{2\pi} \right)^n |u|_{K_\rho} \frac{1}{\rho^{|\alpha|+n}} (2\pi\rho)^n = \alpha! \frac{|u|_{K_\rho}}{\rho^{n+1}}.$$

This holds for all $z \in K$. Thus it must also hold for $z_0 \in \hat{K}$. That is,

$$|a_\alpha| \leq \frac{|u|_{K_\rho}}{\rho^{|\alpha|}}.$$

Note that $z \in D_\rho(z_0)$, then

$$\sum_{\alpha \in \mathbb{N}^n} a_\alpha (\bar{z} - \bar{z}_0)^\alpha,$$

with $|a_\alpha| \leq \frac{|u|_{K_\rho}}{\rho^{|\alpha|}} \rho^{|\alpha|} \leq |u|_{K_\rho}$. Thus $p_{u,z_0}(z)$ must converge in $D_\rho(z_0)$ for $\rho < r$. That is to say $p_{u,z_0}(z)$ converges in $D_\delta(K)(z_0)$. \square

Lemma 9.1. *Let $K \subseteq \mathcal{G}$ be compact. Suppose $z_0 \in \mathcal{G} \setminus \hat{K}$. Then for each $M, \varepsilon > 0$, there is a function $f \in \mathcal{O}(\mathcal{G})$ such that*

$$|f(z_0)| > M, |f|_K < \varepsilon.$$

Proof. Since $z_0 \notin \hat{K}$, there is $\tilde{f} \in \mathcal{O}(\mathcal{G})$ with

$$\tilde{f}(z_0) \geq |\tilde{f}|_K.$$

It is an exercise for the readers to show that, from the equation above, we can obtain $f \in \mathcal{O}(\mathcal{G})$ such that $f(z_0) > 1 > |f|_K$.

Now take high powers of f . \square

Proposition 9.2. *Let \mathcal{G} be a domain which is holomorphically convex. Let (x_j) be a sequence with accumulation points in \mathcal{G} . Then there is $f \in \mathcal{O}(\mathcal{G})$ unbounded on that sequence.*

Proof. Let $K_1 \subseteq K_2 \subseteq \dots$ be a compact exhaustion of \mathcal{G} . That is for each compact set K of \mathcal{G} is contained in one of K_i . This is justified since \mathcal{G} is a domain and topologies defined on \mathbb{R}^n . Clearly, we have,

$$\hat{K}_1 \subseteq \hat{K}_2 \subseteq \dots$$

By the assumption, this is again a compact exhaustion. From now on, let $K_j = \hat{K}_j$ without loss of generality. Pick a sequence $(j_i)_{i \in \mathbb{N}}$ such that

$$x_{j_i} \notin K_i, x_{j_1} \in K_{j_2}, j_i \leq j_{i+1}.$$

After renumbering replace $(x_i)_{i \in \mathbb{N}}$ with $(x_{j_i})_{i \in \mathbb{N}}$. Let $(f_i)_{i \in \mathbb{N}}$ be a sequence in $\mathcal{O}(\mathcal{G})$. Then,

$$|f_1(x_1)| \geq \frac{1}{2} > |f|_{K_1},$$

for for $i \geq 2$,

$$|f_i(x_i)| > i + \sum_{k=1}^{i-1} |f_k(x_i)|, |f_i|_{K_i} < \frac{1}{2^i}.$$

Now take,

$$f(x) = \sum_{j=1}^{\infty} f_j(x).$$

Observe that,

$$\begin{aligned} |f(x_m)| &= \left| \sum_{j \leq m} f_j(x_m) + \sum_{j > m} f_j(x_m) \right|, \\ &\geq |f_m(x_m)| - \sum_{j < m} |f_j(x_m)| - \sum_{j > m} |f_j(x_m)|, \\ &> m - 1. \end{aligned}$$

Thus f is unbounded on the sequence. \square

Theorem 9.2. *The following are equivalent for a domain $\mathcal{G} \subseteq \mathbb{C}^n$.*

- 1). \mathcal{G} is a domain of holomorphy.
- 2). \mathcal{G} is holomorphically convex.
- 3). \mathcal{G} is a domain of existence.

Proof. Let us first show that 1) \Rightarrow 2). Let \mathcal{G} be a domain of holomorphy. and K be a compact subset of \mathcal{G} . Set $z_0 \in \hat{K}$ such that

$$r_0 = \delta(z_0), r = \delta(K).$$

Assume that $r_0 < r$ then $(D_{r_0}(z_0), D_r(z_0))$ is an extension pair. Let $u \in \mathcal{O}(\mathcal{G})$, from Cartan-Thullen, set $p_{u,z_0}(z)$ be the power series of u around z_0 . Let $F(z) = z_0$. Then F converges on $D_r(z_0)$ and $F \equiv u$ on $D_{r_0}(z_0)$. We obtained

a extension $(D_{r_0}(z_0), D_r(z_0), F)$ of u which contradicts that \mathcal{G} is a domain of holomorphy. We conclude $r_0 \geq r$. In particular, for any $z_0 \in \hat{K}$ we have,

$$\delta(z_0) \geq r.$$

This shows that \hat{K} is bounded. Let $z_0 \in \overline{\hat{K}}$, then there are $(z_i)_{i \in \mathbb{N}}$ in \hat{K} such that $z_i \rightarrow z_0$. If $z_0 \in \mathcal{G}$ then $z_0 \in \hat{K}$. If $z_0 \in \partial\mathcal{G}$ then $\delta(z_j) \rightarrow 0$ as but $\delta(z) > 0$. Thus $z_0 \in \hat{K}$. Thus K is closed and bounded, that is it is compact in \mathbb{C}^n .

For 2) \Rightarrow 1) is shown in a previous proposition. For 2) \Rightarrow 3), consider a compact exhaustion $(K_i)_{i \in \mathbb{N}}$ of \mathcal{G} . From the argument of previous propositions, we assume $K_i = \hat{K}_i$ without loss of generality. Let $\{x'_i\}_{i \in \mathbb{N}}$ be a sequence of rational points, which is everywhere dense in \mathcal{G} . Consider another sequence,

$$x'_1, x'_1, x'_2, x'_1, x'_2, x'_3, \dots,$$

that each element occurs infinitely many times. Rename this to $(x_i)_{i \in \mathbb{N}}$ and set $D_i = D_{\delta(x_i)}(x_i)$. Observe that $\overline{D_i} \cap \partial\mathcal{G} \neq \emptyset$. Take $y_i \in D_i \setminus K_i$, and $\tilde{f} \in \mathcal{O}(\mathcal{G})$ with $|\tilde{f}(y_i)| > |\tilde{f}_j|_{K_i}$. As in the proof of the previous proposition we have $f_i \in \mathcal{O}(\mathcal{G})$, $f_i(y_i) = 1$ and $|f_i|_{K_i} < \frac{1}{2^i}$. We set,

$$f(z) = \prod_{i=1}^{\infty} (1 - f_i(z))^i.$$

Then for a compact set $K \subset K_{i_0}$ we have,

$$\sum_{i \geq i_0} i |f_i(z)| \leq \sum_{i \geq i_0} i 2^{-i} < \infty.$$

This shows that f is holomorphic. We also note that at i_i , $f(y_i) = 0$ of order $\geq j$. Let U_3 be the union of all open subsets of $\mathcal{G} \cap U_2$ that meets U_1 , then there exists $z \in \partial\mathcal{G} \cap \partial U_3 \cap U_2$ such that $D_r(z) \subset\subset U_2$.

Now assume that F holomorphic on U_2 and coincide with f on U_1 . By identity theorem, $F \equiv f$ on U_3 . In particular on $D_r(z) \cap U_3$. Thus F is holomorphic on $\overline{D_r(z)}$.

There is j such that $x_j \in D_{\frac{r}{2}}(z)$,

$$D = D_j := D_{\delta(x_j)}(x_j).$$

Let $x_{j_p} \rightarrow x$ for some subsequence let $y_{j_p} \in D_j(x)$. Since we have,

$$D_{\delta(x_j)}(x_j) \subset\subset D_r(z),$$

and $F \equiv f$ on $D_r(z)$. F has zeros of order j_p at $y_{j_p} \in \overline{D_r(z)}$. F is holomorphic function with unbounded zeros on compact set $\overline{D_r(z)}$. Such F does not exist thus we derived a contradiction. Therefore, f cannot be extended. \square

Remark 9.5. Let $f \in \mathcal{O}(U)$ and $a \in U$. If we have,

$$f = \sum_{i=0}^{\infty} f_i.$$

where f_i has pole at $z - a$ and $o(f) = k \Leftrightarrow f_k \neq 0$. Then the function,

$$o : U \rightarrow \mathbb{Z},$$

which is upper semi-continuous. Thus for a compact subset $K \subseteq U$, $o(f)$ is bounded on K .

9.2 Pseudoconvexity

Definition 9.7. A function $h : U \rightarrow \mathbb{R}$ where $U \subset \mathbb{C}$ is harmonic if it is l^2 and $\Delta h = 0$ where

$$\Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} = 4 \frac{\partial^2}{\partial z \partial \bar{z}}.$$

Theorem 9.3 (Dirichlet problem). Let D be a disk and $\Gamma = \partial D$. Suppose $\varphi : \Gamma \rightarrow \mathbb{R}$ is continuous. Then there exist a continuous function $h : \overline{D} \rightarrow \mathbb{R}$ such that

$$h|_{\Gamma} = \varphi,$$

and h is holomorphic on D .

Theorem 9.4 (Fejer's theorem). Let $\Gamma = \{z \in \mathbb{C} \mid |z| = 1\}$. Then the functions $\{\Re p(z) \mid p \text{ is holomorphic polynomial}\}$ is dense in $\mathcal{C}_{\mathbb{R}}^0(\Gamma)$.

Definition 9.8. Let $U \subseteq \mathbb{C}$ and $\varphi : U \rightarrow \mathbb{R} \cup \{-\infty\}$. φ is said to be subharmonic if is it upper semi-continuous nad for each $D \subset\subset U$, a disk, and for each continuous functional h on \overline{D} which is holomorphic on D , if $h \geq \varphi$ on Γ then $h \geq \varphi$ on all of \overline{D} .

Remark 9.6. In \mathbb{R} , we have a correspondence between,

$$\text{linear} \leftrightarrow \text{harmonic}, \text{convex} \leftrightarrow \text{subharmonic}.$$

Remark 9.7. If φ is subharmonic, we have, for all $z_0 \in U$, there exists $r_0 > 0$ such that for $r \leq r_0$,

$$\varphi(z_0) \leq \frac{1}{2\pi} \int_0^{2\pi} \varphi(z_0 + re^{i\theta}) d\theta. \quad (17)$$

Theorem 9.5. The following statements are equivalent.

- 1). φ is harmonic, then it is subharmonic.
- 2). If φ is subharmonic, we have, for all $z_0 \in U$, there exists $r_0 > 0$ such that for $r \leq r_0$, Equation (17) holds.

3). If φ is subharmonic then for all $z_0 \in U$, and any $r_0 > 0$ such that $D_{r_0}(z_0) \subset\subset U$, Equation (17) holds.

Remark 9.8. We have the following facts

- 1). φ is subharmonic then it satisfies locally mean principle.
- 2). If $\varphi \not\equiv -\infty$ which is subharmonic then φ is locally integrable.
- 3). Let φ, ψ be subharmonic then so is their sum $\varphi + \psi$.
- 4). φ is subharmonic if and only if at each point $z_0 \in U$, there is a neighborhood $V(z_0)$ of z_0 such that φ is subharmonic on $V(z_0)$.
- 5). Let φ
- 6). Let f be holomorphic function then $\log|f|, |f|$ are subharmonic.

Theorem 9.6. Let φ be subharmonic in \mathcal{G} , a domain. Suppose $\varphi \not\equiv -\infty$. Then φ is locally integrable.

Proof. Let $z_0 \in \mathcal{G}$ with $\varphi(z_0) > -\infty$. And $D = D_r(z) \subset\subset \mathcal{G}$, Assume that $h : \overline{D} \rightarrow \mathbb{R}$ is continuous and $h \geq \varphi$ on \overline{D} .

$$\begin{aligned} \int_{\overline{D}} h(z)d\lambda(z) &= \int_0^r \rho d\rho \int_0^{2\pi} h(z_0 + \rho e^{i\theta})d\theta, \\ &\geq \int_0^r \rho d\rho \int_0^{2\pi} h(z + \rho e^{i\theta})d\theta \end{aligned}$$

□

Remark 9.9. Let $M = \{z \in U \mid \varphi \text{ is not integrable in } D(z)\}$. Then M is a closed set by definition.

Remark 9.10. Let $z_0 \in M$ where M is as above, $D_r(z)$ has points z with $\varphi(z) = \infty$. Thus in the setting of the previous theorem,

Theorem 9.7. Let φ be of \mathcal{C}^2 , then φ is subharmonic if and only if $\Delta\varphi \geq 0$.

Proof. Assume $\Delta\varphi(z_1) < 0$. That is there exist $r > 0, z_1 \in U$ $\Delta\varphi < 0$ on $D_r(z_1)$. Let h be continuous on $\overline{D_r(z_1)}$ which is harmonic on $D_r(z_1)$. Then

$$\varphi \leq h$$

on $\partial D_r(z_1)$. Set $\psi = \varphi - h$. If φ were subharmonic then $\psi \leq 0$ on $\overline{D_r(z_1)}$. Suppose ψ takes minimum at z_0 . We have on $D_r(z)$,

$$\Delta\psi = \Delta\varphi$$

We have,

$$\Delta\psi(z_0) < 0,$$

which is not possible thus φ is not subharmonic.

Assume $\Delta\varphi > 0$ and φ is not subharmonic. Then there exists a continuous function h on $\overline{D_r(z_0)}$ with $\varphi \leq h$ on $\partial D_r(z_0)$ but $\varphi > h$ somewhere. Set $\psi = \varphi - h$. Similar to the previous case we have $\psi \leq 0$ on $\partial D_r(z_0)$ therefore $\psi\varphi > 0$ somewhere on $D_r(z_0)$ thus has a maximum in $D_r(z_0)$. There $\Delta\psi > 0$.

So φ is subharmonic if $\Delta\varphi > 0$. On the other hands, $\Delta\varphi \geq 0$ then

$$\varphi_\varepsilon := \varphi + \varepsilon|z|^2, \Delta\varphi_\varepsilon > 0.$$

φ_ε is subharmonic so is φ . \square

Theorem 9.8. Suppose f is holomorphic then $\log|f|$ and $|f|, |f|^2$ are all subharmonic.

Proof. Note that

$$\log|f| \leq \Re(P(z)),$$

on $\Gamma = \partial D$ where P is a holomorphic polynomial. To show

$$\exp(\log|f|) \leq \exp(\Re(p(z))) = |e^{P(z)}|,$$

on Γ . Therefore, we have,

$$|f \exp^{-P(z)}| \leq 1$$

on Γ so on all of \overline{D} . Thus we conclude, on \overline{D} we have,

$$\log|f| \leq \Re(P(z)).$$

For $|f|$ we have,

$$|f(z_0)|e^{i\alpha} = f(z_0) = \frac{1}{2\pi i} \int_0^{2\pi} \varphi(z_0 + re^{i\theta}) d\theta.$$

That is

$$\begin{aligned} |f(z_0)| &= \frac{1}{2\pi} \int_0^{2\pi} e^{-i\alpha} f(z_0 + re^{i\theta}) d\theta, \\ &\leq \frac{1}{2\pi} \int_0^{2\pi} |f(z_0 + re^{i\theta})| d\theta, \\ &= \frac{1}{2\pi} \int_0^{2\pi} |f|(z_0 + re^{i\theta}) d\theta. \end{aligned}$$

For the last part, we have $|f|^2 = f\bar{f}$. Thus it is equivalent to show that the right hand side is subharmonic. Indeed,

$$\frac{\partial^2}{\partial z \partial \bar{z}}(f\bar{f}) = \left| \frac{\partial f}{\partial z} \right|^2 \geq 0.$$

\square

9.3 Plurisubharmonic functions

Definition 9.9. Let $U \subseteq \mathbb{C}^n$ and $\varphi : U \rightarrow \mathbb{R} \cup \{-\infty\}$. φ is plurisubharmonic if

- i). φ is upper semi-continuous,
- ii). $\varphi|_L$ is subharmonic for any complex line $L : z = a + \omega t$ where $a \in U$ and $\omega \in \mathbb{C}^n \setminus \{0\}$.

Remark 9.11. We have following facts about plurisubharmonic functions.

- 1). For any $c \in \mathbb{R}$, c is plurisubharmonic.
- 2). φ, ψ are plurisubharmonic so is the sum $\varphi + \psi$ and the positive scalar product of it.
- 3). φ, ψ are plurisubharmonic then $\max(\varphi, \psi)$ is also plurisubharmonic.
- 4). $(\varphi_i)_{i \in I}$ is a sequence of plurisubharmonic functions then its limit is also plurisubharmonic if it exists.
- 5). φ is locally plurisubharmonic then it is globally plurisubharmonic.
- 6). φ satisfies the local maximal principle.

Proposition 9.3. Let $\varphi \neq -\infty$ be a plurisubharmonic function then φ is locally integrable.

Proof. It is proven for $n = 1$. Use induction and the Fubini's theorem. \square

Example 9.2. Suppose f be holomorphic then $|f|, \log |f|, |f|^2 = f\bar{f}$ are all plurisubharmonic.

Example 9.3. Suppose f be holomorphic and $V(f) = \{f = 0\}$. That is $\log |f| = -\infty$ on $V(f)$. Thus $V(f)$ has Lebesgue measure 0.

Remark 9.12.

$$\{\varphi = -\infty \mid \varphi \text{ is plurisubharmonic}\}$$

is called the pluripolar set.

Definition 9.10 (Levi form). Let $\varphi \in \mathcal{C}^2(U, \mathbb{R})$. The Levi matrix of φ is

$$L_\varphi(z) = \left(\frac{\partial^2 f}{\partial z_j \bar{z}_k} \right)_{j,k=1,\dots,n}.$$

The Levi form of φ is

$$L_\varphi(z, t) = \sum_{j,k=1,\dots,n} \frac{\partial^2 f}{\partial z_j \partial \bar{z}_k}(z) t_j \bar{t}_k.$$

Remark 9.13. $L_\varphi(z)$ is Hermitian and observe

$$L_\varphi(z, t) = (t_1 \ \cdots \ t_n) L_\varphi(z) \begin{pmatrix} t_1 \\ \vdots \\ t_n \end{pmatrix}.$$

Proposition 9.4 (Change of coordinates). *Let F be a biholomorphic map and $z = F(w)$. Then we have,*

$$L_{\varphi \circ F}(w) = (J_F^h)^t(w) L_\varphi(F(w)) \overline{J_F^h}(w).$$

Definition 9.11. *We define (\mathbb{C}^n, z) to be the tangent space of \mathbb{C}^n at z .*

Remark 9.14. *Let F be biholomorphic and $z = F(w)$. Then we have,*

$$(\mathbb{C}^n, w) \ni s \mapsto F_* s := J_F^h s.$$

That is

$$L_{\varphi \circ F}(w, s) = L_\varphi(F(w), F_* s).$$

Remark 9.15. *Rank and index of L are invariant under the changes of coordinate. All eigenvalues of L are real by a suitable holomorphic coordinate change, we obtain,*

$$L_\varphi(z) = \text{diag}(\underbrace{1, \dots, 1}_{r_+}, \underbrace{-1, \dots, -1}_{r_-}, \underbrace{0, \dots, 0}_{r_0}).$$

By a unitary transform we have,

$$L_\varphi(z) = \text{diag}(\lambda_1, \dots, \lambda_{r_+}, \mu_1, \dots, \mu_{r_-}, 0, \dots, 0).$$

Proposition 9.5. φ is of \mathcal{C}^2 class if and only if $L_\varphi(z) \geq 0$.

Proof. Let q be a complex line $q : z_0 + wt$ for $w \neq 0$. Note $\varphi|_q = \varphi(z_0 + wt)$ has to be such that

$$\frac{\partial^2}{\partial t \partial \bar{t}} \varphi(z_0 + wt)|_{t=0} = \sum_{j,k} \frac{\partial^2}{\partial z_j \partial \bar{z}_k} \varphi(z_0 + wt) w_j \bar{w}_k \geq 0.$$

□

Definition 9.12. φ is called strictly plurisubharmonic if its Levi form is positive-definite (ie. $L_\varphi(z) > 0$).

Example 9.4. $\varphi(z) = \|z\|^2$ is strictly subharmonic. Indeed

$$L_\varphi = I_n.$$

Theorem 9.9. *Let \mathcal{G} be a domain and $\mathcal{G}' \subset \subset \mathcal{G}$ be relatively compact in \mathcal{G} . Let $\varphi : \mathcal{G} \rightarrow \mathbb{R} \cup \{-\infty\}$ be plurisubharmonic function. Then there is a sequence $(\varphi_n)_{n \in \mathbb{N}}$ of strictly smooth, plurisubharmonic functions on \mathcal{G}' such that $\varphi_n \rightarrow \varphi$ on \mathcal{G}' .*

Theorem 9.10. Let $F : U \rightarrow V$ be biholomorphic and $\varphi : V \rightarrow \mathbb{R} \cup \{-\infty\}$ is plurisubharmonic. Then $\varphi \circ F$ is also plurisubharmonic on U .

Definition 9.13. Let $\mathcal{G} \subseteq \mathbb{C}^n$ be a domain. It is called a pseudoconvex if \mathcal{G} has a strictly plurisubharmonic \mathcal{C}^2 exhaustive function φ . That is $\varphi : \mathcal{G} \rightarrow \mathbb{R}$ is a strictly plurisubharmonic and

$$\mathcal{G}_c := \{z \in \mathcal{G} \mid \varphi(z) < c\} \subset\subset \mathcal{G}.$$

(Recall relatively compact, $A \subset\subset B$ means \overline{A} is compact and contained in B).

Example 9.5. Take $\mathcal{G} = \mathbb{C}^n$ and $\varphi(z) = \|z\|^2$, then \mathcal{G} is pseudoconvex.

Definition 9.14. A function $\delta : \mathbb{C}^n \rightarrow \mathbb{R}_{\geq 0}$ is called a distance function if

- i). it is continuous,
- ii). $\delta(z) = 0 \Leftrightarrow z = 0$,
- iii). $\delta(cz) = |c|\delta(z)$ for any $c \in \mathbb{C} \setminus \{0\}$.

Definition 9.15. Let δ be a distance function and \mathcal{G} be a domain, we define,

$$\delta_{\mathcal{G}}(z) = \inf\{\delta(z - w) \mid w \in \partial\mathcal{G}\}.$$

Theorem 9.11. Let \mathcal{G} be domain. Then the following are equivalent.

- 1). It is pseudoconvex.
- 2). \mathcal{G} has a continuous plurisubharmonic exhaustive function.
- 3). \mathcal{G} has a strictly plurisubharmonic \mathcal{C}^2 exhaustive function.
- 4). There exists a distance function δ such that $u(z) = -\log \delta(z)$ is plurisubharmonic.
- 5). For any distance function δ , $u(z) = -\log \delta(z)$ is plurisubharmonic.

Definition 9.16. Let $\mathcal{G} \subset\subset \mathbb{R}^n$ be a domain. It is said to have a smooth boundary if there exists $U = U(\partial\mathcal{G})$ and $r : U \rightarrow \mathbb{R}$ such that r is \mathcal{C}^∞ and $dr(x) \neq 0$ for any $x \in U$. Furthermore, we have,

$$U \cap \mathcal{G} = \{x \in U \mid r(x) < 0\}, \partial\mathcal{G} = \{r = 0\}.$$

Let $k \in \mathbb{N}$. \mathcal{G} is said to have \mathcal{C}^k boundary with a boundary function r such that if \tilde{r} is another boundary function of \mathcal{C}^k -class. We have, $\tilde{r} = hr$ for some $h > 0$ where h is \mathcal{C}^k outside $\partial\mathcal{G}$ and of \mathcal{C}^{k-1} everywhere.

Remark 9.16. For a domain $\mathcal{G} \subset\subset \mathbb{R}^n$. Then

$$\delta(x) = \begin{cases} \text{dist}(x, \partial\mathcal{G}) & x \notin \overline{\mathcal{G}}, \\ -\text{dist}(x, \partial\mathcal{G}) & x \in \overline{\mathcal{G}}. \end{cases}$$

If \mathcal{G} has \mathcal{C}^k boundary then $\delta(x)$ is also a boundary function.

Proposition 9.6. Let $\mathcal{G} \subset\subset \mathbb{C}^n$ with \mathcal{C}^k boundary with $r : U(\partial\mathcal{G}) \rightarrow \mathbb{R}$ a boundary function that is plurisubharmonic. Then \mathcal{G} is pseudoconvex.

Proof. Let $\varphi(z) = -\log(-r)$. Then

$$\frac{\partial^2}{\partial z_j \partial \bar{z}_k} \varphi = \frac{\partial}{\partial z_j} \frac{-\frac{\partial r}{\partial \bar{z}_k}}{r} = -\frac{\frac{\partial^2}{\partial z_j \partial \bar{z}_k} r}{r} + \frac{\frac{\partial r}{\partial z_j} \frac{\partial r}{\partial \bar{z}_k}}{r^2}.$$

Therefore, we have,

$$\begin{aligned} \sum \frac{\partial^2}{\partial z_j \partial \bar{z}_k} \varphi t_j \bar{t}_k &= -\frac{1}{r} \sum \frac{\partial^2}{\partial z_j \partial \bar{z}_k} r t_j \bar{t}_k + \frac{1}{r^2} \sum \frac{\partial r}{\partial z_j} t_j \frac{\partial r}{\partial \bar{z}_k} \bar{t}_k, \\ &= \dots + \frac{1}{r^2} \left(\left| \sum \frac{\partial r}{\partial z_j} t_j \right|^2 \right) \geq 0. \end{aligned}$$

Extend φ to all of $\bar{\mathcal{G}}$ in \mathcal{C}^k . We have there exists a plurisubharmonic function close to the boundary. Now pass to

$$\varphi(z) + A\|z\|.$$

It is plurisubharmonic on all of \mathcal{G} if A is large enough. \square

Definition 9.17. Let $\mathcal{G} \subset\subset \mathbb{C}^n$ and $\mathcal{G} = \{r < 0\}$. We say \mathcal{G} satisfies the Levi condition if for any $z \in \partial\mathcal{G}$,

$$\sum_{j,k=1}^n \frac{\partial^2}{\partial z_j \partial \bar{z}_k} r(z) t_j \bar{t}_k \geq 0, \quad (\text{L})$$

for all $t \in \mathbb{C}^n$ with

$$\sum \frac{\partial r}{\partial j}(z) t_j = 0.$$

Definition 9.18. $\mathcal{G} = \{r < 0\}$ satisfies the strong Levi condition if

$$\sum_{j,k=1}^n \frac{\partial^2}{\partial z_j \partial \bar{z}_k} r(z) t_j \bar{t}_k > 0, \quad (\text{SL})$$

for all $t \in \mathbb{C}^n \setminus \{0\}$ with

$$\sum \frac{\partial r}{\partial j}(z) t_j = 0.$$

Remark 9.17. If r satisfies either of (L) or (SL) so do all other boundary functions.

Remark 9.18 (Geometric Interpretation). Consider $z \in \partial\mathcal{G}$ and (\mathbb{C}^n, t) the real tangent space to $\partial\mathcal{G}$ at z . Then

$$\sum \frac{\partial r}{\partial z_j}(z) t_j + \sum \frac{\partial r}{\partial \bar{z}_k}(z) \bar{t}_k = 0,$$

gives the maximal compact tangent space to $\partial\mathcal{G}$ at z singled out by

Proposition 9.7. Let $\mathcal{G} \subset\subset \mathbb{C}^n$ with smooth boundary. It is pseudoconvex if and only if each boundary function satisfies (L) at all boundary points.

Proof. See [4] Lemma 2.11. \square

Definition 9.19. Let $\mathcal{G} \subset\subset \mathbb{C}^n$ with smooth boundary. It is pseudoconvex if the boundary function satisfies (SL).

Proposition 9.8. Let \mathcal{G} be a domain. It is strictly pseudoconvex if and only if there exists a strictly plurisubharmonic boundary function.

Proof. See [4]. \square

Remark 9.19. Suppose \mathcal{G} is strictly pseudoconvex. For any boundary point of the domain, we can find a biholomorphic function defined on a neighborhood of the point such that the image is convex.

Remark 9.20. All smooth domains in \mathbb{C} are strictly pseudoconvex. For the detailed proof, see [5].

Definition 9.20. Let $\mathcal{G} \subset\subset \mathbb{C}^n$ be pseudoconvex and φ be a strictly plurisubharmonic exhaustive function, set,

$$\mathcal{G}_c = \{x \in \mathcal{G} \mid \varphi(x) < c\}.$$

c is called critical if $\varphi(x) = c$ then $d\varphi(x) \neq 0$.

Remark 9.21. The set of critical values in \mathbb{R} have measure 0. And there is always a sequence $\mathcal{G}_r \subset\subset \mathcal{G}$ where \mathcal{G}_v is strictly pseudoconvex and $\mathcal{G}_r \subset\subset \mathcal{G}_{r+1}$. Moreover,

$$\bigcup \mathcal{G}_r = \mathcal{G}.$$

10 The Levi Problems

Theorem 10.1. Let \mathcal{G} be holomorphically convex, then it is pseudoconvex.

Proof. Without loss of generality, there is a compact exhaustion

$$K_j \subset K_{j+1}^\circ \subset K_{j+1},$$

such that $K_j = \hat{K}_j$, and each compact subset K of \mathcal{G} is contained in some K_j . Fix j and consider $z \in K_{j+2} - K_{j+1}^\circ$. we find $f \in \mathcal{O}(\mathcal{G})$ such that $|f(z)|^2 > j$ and

$$|f|_{K_j}^2 < 1.$$

By continuity of f , this holds for some neighborhood of z . By the compactness, we find a finitely many functions f_1, \dots, f_m such that

$$\sum |f_i|^2 > j \quad \text{on } K_{j+2} - K_{j+1}^\circ,$$

and for each $|f_i|_{K_j} < 1$. Passing to f_i^N for some N large enough, obtain for each j ,

$$f_1^j, \dots, f_{m_j}^j,$$

with

$$\sum_{i=1}^{m_j} |f_i^j|^2 > j \quad \text{on } K_{j+2} - K_{j+1}^\circ,$$

$$\sum_{i=1}^{m_j} |f_i^j|^2$$

Set

$$\varphi_j = \sum_{i=1}^{m_j} |f_i^j|^2,$$

and,

$$\varphi = \sum_{j=0}^{\infty} \varphi_j,$$

which is locally uniformly convergent and thus φ is obviously continuous.

We claim it is differentiable. Set,

$$\phi_j(z, w) = \sum f_i^j(z) \overline{f_i^j(w)}.$$

Then this is holomorphic in z and \bar{w} . Thus $\phi(z, w) = \sum_{j=0}^{\infty} \phi_j(z, w)$ which is locally uniformly convergent, is also holomorphic but

$$\varphi(z) = \phi(z, \bar{z}),$$

thus φ is differentiable. \square

Our goal of the chapter is to study the following theorem

Theorem 10.2 (Levi Problem). *Pseudoconvex domains are also holomorphically convex.*

Remark 10.1. *The Levi condition for $\mathcal{G} = \{r < 0\}$ in dimension 2 can be restated by*

$$\det \begin{pmatrix} 0 & \frac{\partial r}{\partial z_1} & \frac{\partial r}{\partial z_2} \\ \frac{\partial r}{\partial \bar{z}_1} & \frac{\partial^2 r}{\partial z_1 \partial \bar{z}_1} & \frac{\partial^2 r}{\partial z_2 \partial \bar{z}_1} \\ \frac{\partial r}{\partial \bar{z}_2} & \frac{\partial^2 r}{\partial z_1 \partial \bar{z}_2} & \frac{\partial^2 r}{\partial z_2 \partial \bar{z}_2} \end{pmatrix} \leq 0.$$

11 Cauchy-Riemann Equations

We will consider (p, q) -forms which are given by

$$\begin{aligned} f &= \sum_{\substack{1 \leq i_1 < \dots < i_p \leq n \\ 1 \leq j_1 < \dots < j_q \leq n}} f_{i_1, \dots, i_p, j_1, \dots, j_q} dz_{i_1} \wedge \dots \wedge dz_{i_p} \wedge d\bar{z}_{j_1} \wedge \dots \wedge d\bar{z}_{j_q}, \\ &= \sum_{\substack{|I|=p \\ |J|=q}} f_{I,J} dz^I \wedge d\bar{z}^J. \end{aligned}$$

In general $f \in \mathcal{C}^\infty(U)$, we set,

$$E^{p,q}(U) = \mathcal{C}_{p,q}^\infty(U).$$

Also we denote,

$$\bar{\partial}f = \sum \bar{\partial}f_{I,J} \wedge dz^I \wedge d\bar{z}^J.$$

That is for a function f ,

$$\bar{\partial}f = \sum \frac{\partial f}{\partial \bar{z}_j} d\bar{z}_j.$$

Note that $\bar{\partial} \circ \bar{\partial} = 0$.

Consider the ODE

$$\begin{cases} \bar{\partial}u = f, f \in E^{p,q}, \\ \bar{\partial}f = 0. \end{cases}$$

We call u is closed if $\bar{\partial}u = 0$ and exact if such f in the above exists.

If we get rid of p , we have,

$$f \leftrightarrow \binom{n}{p} \text{tuple of } (0, q)\text{-forms.}$$

11.1 Solving Cauchy-Riemann equation - First step

Recall Bochner-Martinelli integral formula.

$$B(\zeta, z) = \frac{1}{2\pi i} \frac{1}{\|\zeta - z\|^{2n}} \beta \wedge (\bar{\partial}_\zeta \beta)^{n-1}, \beta(\zeta, z) = \sum_{j=1, \dots, m} (\bar{\zeta}_j - \bar{z}_j) d\zeta_j.$$

Set $\mathcal{G}, \partial\mathcal{G} \subset \subset \mathbb{C}^n, f \in \mathcal{C}^1(\overline{G}), z \in \mathcal{G}$.

$$f(z) = \int_{\partial\mathcal{G}} f(\zeta) B(\zeta, z) - \int_{\mathcal{G}} \bar{\partial}f(\zeta) \wedge B(\zeta, z).$$

Theorem 11.1. Let $f \in \mathcal{C}_{0,1,C}^1(\mathbb{C}^n)$, $\bar{\partial}f = 0$. Set

$$u(z) = - \int_{\mathbb{C}^n} f(\zeta) \wedge B(\zeta, z).$$

Then u is \mathcal{C}^1 (\mathcal{C}^k if $f \in \mathcal{C}^k$) and $\bar{\partial}u = f$. If $n > 1$ then u has compact support.

Proof. The first question we pose is that whether u is differentiable or not. We have,

$$\begin{aligned} f(\zeta) &= \sum f_j(\zeta) d\bar{\zeta}_j, \\ u(z) &= \sum u_j(z), \\ u_j(z) &= - \int_{\mathbb{C}^n} f_j d\bar{\zeta}_j \wedge B(\zeta, z), \\ &= \text{constant} \int \frac{f_j(\zeta)(\bar{\zeta}_j - \bar{z}_j)}{\|\zeta - z\|^{2n}} dV(\zeta). \end{aligned}$$

Let L_z be a linear partial differential operator (first order) constant coefficients.

$$\begin{aligned} L_z u_j(z) &= \text{constant } L_z \int \frac{f(\zeta)(\bar{\zeta}_j - \bar{z}_j)}{\|\zeta - z\|^{2n}} dV(\zeta), \\ &= \text{constant } L_z \int_{\mathbb{C}^n} \frac{f(z + w) w_j}{\|w\|^{2n}} dV(w), \\ &= \text{constant } \int_{\mathbb{C}^n} \frac{L_z f(z + w \bar{w}_i)}{\|w\|^{2n}} dV(w), \\ &= \text{constant } \int \frac{L_\zeta f(\zeta)(\bar{\zeta}_j - \bar{z}_j)}{\|\zeta - z\|^{2n}} dV(\zeta). \end{aligned}$$

Now we want to show that $\bar{\partial}u = f$, that is

$$\frac{\partial u}{\partial \bar{z}_j} = f_j.$$

For $j = 1$, we see,

$$\begin{aligned} \frac{\partial u}{\partial \bar{z}_1} &= - \int \frac{\partial f}{\partial \bar{\zeta}_1} \wedge B(\zeta, z), \\ &= - \int \left(\frac{\partial f_1}{\partial \bar{\zeta}_1} d\bar{\zeta}_1 + \cdots + \frac{\partial f_n}{\partial \bar{\zeta}_1} d\bar{\zeta}_n \right) \wedge B(\zeta, z). \end{aligned}$$

By the assumption $\bar{\partial}f = 0$ thus we have,

$$\frac{\partial f_1}{\partial \bar{\zeta}_j} = \frac{\partial f_j}{\partial \bar{\zeta}_1}.$$

Thus we have,

$$\begin{aligned}\frac{\partial u}{\partial \bar{z}_1} &= - \int \underbrace{\left(\frac{\partial f_1}{\partial \bar{\zeta}_1} d\bar{\zeta}_1 + \cdots + \frac{\partial f_1}{\partial \bar{\zeta}_n} d\bar{\zeta}_n \right)}_{\bar{\partial}f_1} \wedge B(\zeta, z), \\ &= - \int \bar{\partial}f_1 \wedge B(\zeta, z) = f_1(z).\end{aligned}$$

Add-on: $n > 1$, u is holomorphic outside the support of f then $u(z) \rightarrow 0$ for $z \rightarrow \infty$. Thus $u \equiv 0$ on an open set outside of the support of f . That is it is everywhere 0 on unbounded component of complement of $\text{supp } f$. \square

Remark 11.1. *The Kugelsatz follows from Theorem 11.1.*

Theorem 11.2. *Let $\mathcal{G}, \partial\mathcal{G} \subset \subset \mathbb{C}$ and $f \in \mathcal{C}^1(\bar{\mathcal{G}})$. Let*

$$u(z) = \frac{1}{2\pi i} \int_{\mathcal{G}} \frac{f(\zeta)}{\zeta - z} d\zeta \wedge d\bar{\zeta}, z \in \mathcal{G}.$$

Then $\frac{\partial u}{\partial \bar{z}} = f(z)$.

Proof. Let $z_0 \in \mathcal{G}$ and $D_r(z_0) \subset \subset \mathcal{G}$. Let φ be a smooth function such that

$$\varphi(z) = \begin{cases} 0, & z \notin D_r(z_0), \\ 1, & z \in D_{\frac{r}{2}}(z_0), \\ \text{in } [0, 1], & \text{elsewhere.} \end{cases}$$

We see,

$$u(z) = \underbrace{\int \frac{\varphi(\zeta)f(\zeta)}{\zeta - z} d\zeta \wedge d\bar{\zeta}}_{u_1(z)} + \underbrace{\int \frac{(1 - \varphi(\zeta))f(\zeta)}{\zeta - z} d\zeta \wedge d\bar{\zeta}}_{u_2(z)}$$

For $z \in D_{\frac{r}{2}}(z_0)$, we have,

$$\frac{\partial u}{\partial \bar{z}} = \frac{\partial u_1}{\partial \bar{z}} = \varphi(z)f(z) = f(z).$$

\square

Remark 11.2. *In the above theorem, f depends on additional parameters, then u depends on them in the same way. More precisely, if f and u are related such that there is a linear operator T with*

$$u = Tf,$$

and we have dependencies on f such that

$$f(z; t_1, \dots, t_k), t = (t_1, \dots, t_k) \in V \subseteq \mathbb{R}^k,$$

then

$$D_{t_i}u(z; t_1, \dots, t_k) = T(D_{t_i}f).$$

Such T is the inverse to $\bar{\partial}$ if it exists and called the solution operator.

Suppose we have constructed a solution operator T . For Tf , we want $f \in \mathcal{C}^1(\mathcal{G}) \cap L^1(\mathcal{G})$. You can have estimates in terms of L^1, L^p, L^∞ . BUT if $f \in \mathcal{C}^\infty(\mathcal{G})$, there is $u \in \mathcal{C}^\infty(\mathcal{G})$, $\frac{\partial u}{\partial \bar{z}} = f$, we have weak range approximation. For more detail, see [1] Function Theory.

Definition 11.1. Let $f \in \mathcal{C}_{0,q}^\infty(D)$, $\bar{\partial}f = 0$. We denote $f \in E(k)$ or say f is of complexity k if $f_J = 0$ for all J that contains l greater than k .

Remark 11.3. Clearly $E(0) = 0$, and $E(n) = \mathcal{C}_{0,q}^\infty(D)$.

Theorem 11.3 (Dolbeault lemma). Let $f \in \mathcal{C}_{0,q}^\infty(D)$, $\bar{\partial}f = 0$ where $D \subseteq \mathbb{C}^n$ is a polydisk. Then there is $u \in \mathcal{C}_{0,q-1}^\infty(D)$ with $\bar{\partial}u = 0$.

Note that D is arbitrary, and even \mathbb{C}^n works. u is not given by a linear operator.

Suppose $D'' \subset\subset D'$ Show $f \in \mathcal{C}_{0,q}^\infty(D')$, $\bar{\partial}f = 0$, then there is $u \in \mathcal{C}_{p,q-1}^\infty(D'')$ with $\bar{\partial}f$ on D'' .

Proof. Suppose $f = \sum_{|J|=q} f_J d\bar{z}^J \in \mathcal{C}_{0,q}^\infty(D')$. We will prove the statement by the induction on k for $E(k)$.

For $k = 0$, there is nothing to show.

Suppose the statement holds for $k - 1$, then

$$f = \sum_{|J|=q} f_J d\bar{z}^J \in E(k), \bar{\partial}f = 0.$$

Then take $g, h \in E(k - 1)$ such that $f = d\bar{z}_k \wedge g + h$. And

$$0 = \bar{\partial}f = -d\bar{z}_k \wedge \bar{\partial}g + \bar{\partial}h.$$

Thus we obtain,

$$d\bar{z}_k \wedge \bar{\partial}g = \bar{\partial}h,$$

and we have,

$$g = \sum_{|K|=q-1} g_K d\bar{z}^K.$$

Suppose this is not the case, then on the left, $l > k$, $d_k \wedge d\bar{z}_l \wedge \dots$ but not on the right. We claim that g_K are holomorphic in z_{k+1}, \dots, z_n . By Theorem 11.2, we found G_k of $\frac{\partial G_k}{\partial \bar{z}_k} = g_k$ on D'' . As holomorphic in z_{k+1}, \dots, z_n smooth in all variables.

$$\begin{aligned} G &= \sum_{|K|=q-1} G_K d\bar{z}^K. \\ \bar{\partial}G &= \sum_{K,l < k} \frac{\partial G_k}{\partial \bar{l}} d\bar{z}_l \wedge d\bar{z}^K + \sum_K \frac{\partial G_k}{\partial \bar{k}} \wedge d\bar{z}^K, \\ &= h_1 + d\bar{z}_k \wedge g. \end{aligned}$$

Sum them up we have,

$$f = \bar{\partial}G + \underbrace{(h - h_1)}_{\in E(k-1)} \quad \text{on } D''.$$

We observe further that,

$$\bar{\partial}(h - h_1) = 0, \tag{18}$$

$$(19)$$

and there is u_1 defined on D'' such that $\bar{\partial}u_1 = h - h_1$. Thus we have,

$$f = \bar{\partial}(G + u_1) \quad \text{on } D''.$$

Let $D_0 \subset \subset D_1 \subset \subset D_2 \subset \subset \cdots \subset \subset D$ be a sequence of polydisks that exhausts D . We consider two cases

Case 1. $q > 1$.

Find $u_0 \in \mathcal{C}_{0,q-1}^\infty(D)$ such that $\bar{\partial}u_0 = f$ on D_0 . Assume u_0, u_1, \dots, u_d are such that

$$\bar{\partial}u_i = f \text{ on } D_i, u_i = u_{i-1} \text{ on } D_{i-2}.$$

Find $u'_{d+1} \in \mathcal{C}_{0,q-1}^\infty(D)$ such that

$$\bar{\partial}u'_{d+1} = f \text{ on } D_d.$$

Find $v \in \mathcal{C}_{0,q-2}^\infty(D)$ such that

$$\bar{\partial}v = u'_{d+1} - u_d \text{ on } D_{d-1}.$$

Set $u_{d+1} = u'_{d+1} - \bar{\partial}v$ Then we have,

$$\bar{\partial}u_{d+1} = f \text{ on } D_{d+1}.$$

Furthermore,

$$u_{d+1} - u_d = u'_{d+1} - \bar{\partial}v - u_d = 0 \text{ on } D_{d-1}.$$

Inductively, we get u_0, u_1, \dots . Set $u = \lim_{d \rightarrow \infty} u_d$. On D_k we have

$$u \equiv u_d, d \text{ sufficiently large}, \bar{\partial}u = \bar{\partial}u_d = f.$$

Assume that we found $u_0, u_1, u_2, \dots, u_d$ with

$$\bar{\partial}u_i = f \text{ on } D_i, |u_i - u_{i-1}|_{D_{i-2}} \leq \frac{1}{2^i}.$$

Construct u_{d+1} by taking $u'_{d+1} \in \mathcal{C}^\infty(D)$ such that

$$\bar{\partial}u'_{d+1} = f \text{ on } D_{d+1}.$$

We also have

$$\bar{\partial}(\underbrace{u'_{d+1} - u_d}_{\text{a holomorphic function on } D_d}) = 0 \text{ on } D_d.$$

Let p be a Taylor polynomial of $u'_{d+1} - u_d$ about 0 degree chosen sufficiently large so that

$$|u'_{d+1} - u_d - p|_{D_{d-1}} < \frac{1}{2^{l+1}}.$$

Set $u_{d+1} = u'_{d+1} - p$. Continus this procedure get a sequence u_0, u_1, \dots . Take $u = \lim_{d \rightarrow \infty} u_d$. We observe this is locally uniform. Therefore, u is continuous.

Consider $u - u_m$ then

$$\lim_{\substack{d \rightarrow \infty \\ d > m}} (\underbrace{u_d - u_m}_{\text{holomorphic function for } d \text{ large enough}}).$$

Thus u is of \mathcal{C}^∞ . In particular,

$$\bar{\partial}u = \underbrace{\bar{\partial}(u - u_m)}_{=0} + \bar{\partial}u_m = f.$$

□

Remark 11.4. *In the above proof, we can assume the solution u is $\mathcal{C}_{0,q-1}^\infty(D')$ but $\bar{\partial}u = f$ is true only on D'' .*

Definition 11.2 (Dolbeault Cohomology). *Let D be a polydisk. We define, the Dolbeault cohomology as*

$$H_{\text{Dol}}^{0,q}(D) = \frac{\{f \in \mathcal{C}_{0,q}^\infty \mid \bar{\partial}f = 0\}}{\{\bar{\partial}u \mid u \in \mathcal{C}_{0,q}^\infty\}}.$$

Remark 11.5. *Lemma 11.3 can be restated by the following way.*

$$H_{\text{Dol}}^{0,q}(D) = 0,$$

for any $q \geq 1$. This is shown by first showing the case when $q = 1$, and by induction for higher cases.

For $n = 1$ and \mathcal{G} be an arbitrary domain. Suppose we want to solve the equation,

$$\begin{cases} \bar{\partial}u = f, \\ \frac{\partial u(z)}{\partial \bar{z}} = f(z) \end{cases}.$$

Take $\mathcal{G}_0 \subset \subset \mathcal{G}_1 \subset \subset \dots \subset \subset \mathcal{G}$ such that it exhausts \mathcal{G} . Suppose $\partial\mathcal{G}$ is reasonable(ie. the Stoke's theorem can be applied). Solve $u_j \in \mathcal{C}^\infty(\mathcal{G})$ such that

$$\frac{\partial u_j}{\partial \bar{z}_j}(z) = f(z) \text{ on } \mathcal{G}_j.$$

To do so, we need an approximation theorem. Namely, the Range Approximation Theorem. Then it follows that

$$\exists u \in \mathcal{C}^\infty(\mathcal{G}), \frac{\partial u}{\partial \bar{z}} = f.$$

u was not constructed by a linear operator,

$$\mathcal{C}_{0,q}^\infty \ni f \xrightarrow{T} Tf \in \mathcal{C}_{0,q-1}^\infty. \bar{\partial} Tf = f.$$

Using Functional analysis, we know that such T does not exists. Let $f \in \mathcal{C}_{0,q}^\infty, \bar{\partial} f = 0$, bounded on D .

11.2 Applying the Cauchy-Riemann equation

Definition 11.3 (Meromorphic functions).

Definition 11.4. Let U be an open set. We denote $\mathcal{K}(U)$ to be the set of meromorphic functions on U .

Remark 11.6. We have $\mathcal{O}_x \subset \mathcal{K}_x$ and $\mathcal{K}(U) = \bigsqcup_{x \in U} \mathcal{K}_x$.

Definition 11.5. Let $\mathcal{G} \subseteq \mathbb{C}^n$ be a domain. Cousin-I-distribution is $(U_i, f_i)_{i \in I}$, such that

- i). $(U_i)_{i \in I}$ is an open cover of \mathcal{G} ,
- ii). $f_i \in \mathcal{K}(U_i)$ is a meromorphic function for each $i \in I$ such that $f_j - f_i = f_{ij}$ is a holomorphic function on $U_{ij} = U_i \cap U_j$.

A solution to such a distribution is a meromorphic function f on \mathcal{G} such that $f - f_i$ is holomorphic on U_i for each $i \in I$.

We now want to find a meromorphic function f on \mathcal{G} such that $f - f_i$ is holomorphic on U_i .

Definition 11.6. A divisor of \mathcal{G} is a pair $\Delta = (U_i, f_i)_{i \in I}$ such that

- i). $(U_i)_{i \in I}$ is an open covering of \mathcal{G} ,
- ii). $f_i \not\equiv 0$ is meromorphic in U_i for each $i \in I$,
- iii). $f_j/f_i = f_{ij}$ is holomorphic without zeros on U_{ij} for each pair $i, j \in I$.

Definition 11.7. Let Δ_1, Δ_2 be two divisors. They are said to coincide if $\Delta_1 \cup \Delta_2$ is also a divisor.

Definition 11.8. A divisor of the form (\mathcal{G}, f) is called principle.

Definition 11.9. A solution of such a $\Delta = (U_i, f_i)_{i \in I}$ is a meromorphic function f on \mathcal{G} with f/f_i is holomorphic without zeros on U_i . That is a meromorphic function f on \mathcal{G} such that Δ and (\mathcal{G}, f) coincide.

Second Cousin Problem Are all divisors of a domain \mathcal{G} principal?

Third Cousin Problem Suppose \mathcal{G} be a domain containing the origin. Let $\mathcal{O}(\mathcal{G})$ be an algebra of holomorphic functions and set

$$M_0 = \{f \in \mathcal{O}(\mathcal{G}) \mid f(0) = 0\}.$$

Is it true that $M_0 = (z_1, \dots, z_n)$? That is for any $f \in \mathcal{O}(\mathcal{G})$ with $f(0) = 0$, do we find a solution to the following Diophantine equation,

$$\sum_{j=1}^n f_j(z)z_j = f(z).$$

Fourth Cousin Problem Let $M \subseteq \mathcal{G}$ be anaanalytic set and f be a holomorphic function on M . Is there a holomorphic function F on \mathcal{G} such that $F|_M = f$?

Fifth Cousin Problem Let M be an analytic set of codimension 1. Is there. a holomorphic function f on \mathcal{G} such that $V(f) = M$.

$(U_i, f_i)_{i \in I}$ be a principal part distribution such that $U_i \subset \subset \mathcal{G}$. Let $\{q_i\}_{i \in I}$ be a partition of unity subordinate to $\{U_i\}_{i \in I}$. Set

$$g_i = \sum \varphi_i f_{ji} \text{ on } U_i, \text{ where } f_{ji} = f_i - f_j \text{ on } U_{ij}.$$

Then we have,

$$\begin{aligned} \bar{\partial}g_i - \bar{\partial}g_k &= \bar{\partial} \sum \varphi_j f_{ji} - \sum \varphi_j f_{jk}, \\ &= \bar{\partial} \sum \varphi_j (f_{ji} - f_{jk}), \\ &= \bar{\partial} \sum_j f_{ki} \varphi_j, \\ &= f_{ki} \underbrace{\sum_j \bar{\partial} \varphi_j}_{=0 \text{ as } \bar{\partial} \text{ is a closed } (0,1) \text{ form}} = 0. \end{aligned}$$

Set $r = \bar{\partial}g_i$ on U_i . Globally defined on all of \mathcal{G} .

Assume Cauchy-Riemann equation is solvable, that is there is $u \in \mathcal{C}^\infty(\mathcal{G})$ such that

$$\bar{\partial}u = r.$$

Set $f = f_i - g_i + u$ on U_i . Then $\bar{\partial}f = 0$. Note that f is globally defined. Indeed,

$$(f_i - g_i + u) - (f_k - g_k + u) = f_i - f_k - (g_i - g_k) = 0.$$

Particularly, $f - f_i$ is holomorphic thus f solves the First Cousin problem. That is on a Disk, the First cousin problem is solvable.

Theorem 11.4. *If $(\text{CR})_{0,q}$ is solvable then $M_0 = (z_1, \dots, z_n)$.*

Definition 11.10. *Let \mathcal{G} be a domain in \mathbb{C}^n and $a \in \partial\mathcal{G}$. A boundary point $c \in \partial\mathcal{G}$ is called attainable if there exists $\varepsilon > 0$ such that for some $b \in B_\varepsilon(a) \cap \mathcal{G}$, and δ the Euclidean distance between b and $\partial\mathcal{G}$, we have, $c \in \partial B_\delta(b) \cap \partial\mathcal{G} \cap B_{2\varepsilon}(a)$.*

Remark 11.7. *For each attainable boundary point c , we find a holomorphic function on \mathcal{G} which is not extendable beyond c .*

Example 11.1. *Consider $\mathcal{G} \cap \{z_n = 0\} = \mathcal{G}_0$ not empty and $0 \in \partial\mathcal{G}$. Consider $j : \mathcal{G}_0 \hookrightarrow \mathcal{G}$ and $p : \mathbb{C}^n \rightarrow \mathbb{C}^{n-1}$. Consider*

$$M = \{z \in \mathcal{G} \mid p(z) \notin \mathcal{G}_0\}.$$

This is relatively closed in \mathcal{G} . Also \mathcal{G}_0 is relatively closed in \mathcal{G} . We have $M \cap \mathcal{G}_0 = \emptyset$. So there is a \mathcal{C}^∞ function on \mathcal{G} , $\varphi : \mathcal{G} \rightarrow [0, 1]$ with $\varphi \equiv 1$ on $V(\mathcal{G}_0)$ and $\varphi \equiv 0$ on M .

Theorem 11.5. *If \mathcal{G} is such that $(\text{CR})_{0,q}$ are always solvable then \mathcal{G} is a domain of holomorphy.*

Proof. Let $\mathcal{G} \subseteq \mathbb{C}^n$. The proof is due to induction. For $n = 1$, we have that all domains are holomorphically convex. Suppose we have the case for $n - 1$.

Let $a \in \partial\mathcal{G}$ and $\mathcal{G}_0 = \{z_n = 0\} \cap \mathcal{G}$. Without loss of generality, we assume that $0 \in \partial\mathcal{G}_0$ in \mathbb{C}^{n-1} . Let

$$p : \mathbb{C}^n \rightarrow \mathbb{C}^{n-1}, j : \mathcal{G}_0 \rightarrow \mathcal{G},$$

be canonical projection and injection, respectively. We set,

$$M := \{z \in \mathcal{G} \mid p(z) \notin \mathcal{G}_0\}.$$

Then M, \mathcal{G}_0 are closed in \mathcal{G} and $M \cap \mathcal{G}_0 = \emptyset$. Take $\varphi \in \mathcal{C}^\infty(\mathcal{G})$ such that $0 \leq \varphi \leq 1$ and

$$\varphi(\mathcal{G}_0) = \{1\}, \varphi(M) = \{0\}.$$

We first show that $f \in \mathcal{C}_{0,q}^\infty(\mathcal{G}_0), \bar{\partial}f = 0$ then there is $F \in \mathcal{C}_{0,q}^\infty(\mathcal{G})$ such that $\bar{\partial}F = 0$ and $F|_{\mathcal{G}_0} = f$ that is $F \circ j = f$.

Indeed $\varphi(f \circ p) \circ j = f$. Therefore take

$$F = \varphi(f \circ p) - z_n u,$$

where $u \in \mathcal{C}_{0,q}^\infty(\mathcal{G})$ so that

$$\bar{\partial}F = 0.$$

That is

$$0 = \bar{\partial}F = \bar{\partial}\varphi \circ (f \circ p) - z_n \bar{\partial}u \Rightarrow \bar{\partial}u = \frac{1}{z_n} \bar{\partial}\varphi \circ (f \circ p) \in \mathcal{C}_{0,q+1}^\infty(\mathcal{G}).$$

This is $\bar{\partial}$ -closed. Thus there is $v \in \mathcal{C}_{0,q}^\infty$ such that $\bar{\partial}F = 0$ and $F \circ j = f$.

We now show that \mathcal{G}_0 satisfies the assumption in \mathbb{C}^{n-1} .

Indeed If $f \in \mathcal{C}_{0,q}^\infty(\mathcal{G}_0)$ and $\bar{\partial}f = 0$ extend f to F as before. There is $u \in \mathcal{C}_{0,q-1}^\infty(\mathcal{G})$ with $\bar{\partial}u = F$. Take $v = u \circ j$, we then have,

$$\bar{\partial}v = f.$$

For the induction hypothesis, there is $f \in \mathcal{O}(\mathcal{G}_0)$ not extendable beyond 0. As we have shown, f extends to a holomorphic function F on \mathcal{G} and F cannot be extended beyond 0. \square

Our next goal is to study $(\text{CR})_{0,q}$ solvability on pseudoconvex domains, namely

$$H_{\text{Dol}}^{p,q}(\mathcal{G}) = 0$$

for $q \geq 1$ and all p .

12 Sheaves of cohomology

The main reference if [6] but the exposition with more details will be found in [2].

12.1 Sheaves

Definition 12.1. Let S, X be topological spaces. A pair $(\mathcal{S}, \pi : \mathcal{S} \rightarrow X)$ is called a sheaf on X if $\pi : \mathcal{S} \rightarrow X$ is a local homeomorphism. We will denote it simply by \mathcal{S} .

Definition 12.2. Let $U \subseteq X$ be an open subset. For a sheaf \mathcal{S} on X . The section of \mathcal{S} over U is a continuous map $s : U \rightarrow \mathcal{S}$ such that $\pi \circ s = \text{id}$. The stalk of \mathcal{S} at $x \in X$ is the preimage $S_x = \pi^{-1}(x)$.

Proposition 12.1 (Fundamental Properties of Sheaves). Let S be a sheaf on X .

- 1). For a section $s : U \rightarrow S$, $s(U)$ is open. In particular, $\pi|_{s(U)} : s(U) \rightarrow U$ is a homeomorphism.
- 2). $\{s(U)\}_{U \subset X \text{ open}}$ forms a basis of the topology of S .
- 3). S_x carries the discrete topology.
- 4). $\sigma \in S_x$ then there is a neighborhood $U = U(x)$ of x and a section $s : U \rightarrow S$ such that $s(x) = \sigma$.
- 5). Let s, t be sections such that $s(x_0) = t(x_0)$. Then there is a neighborhood $U = U(x_0)$ such that $s \equiv t$ on U .

Definition 12.3. A subsheaf (\mathcal{S}', π') of a sheaf $\mathcal{S} \xrightarrow{\pi} X$ is a pair such that $\mathcal{S}' \subseteq \mathcal{S}$ is an open subset and $\pi' = \pi|_{\mathcal{S}'}$.

In particular, for a open subset $M \subseteq X$, $\pi^{-1}(M)$ is a subsheaf which is called a restriction of \mathcal{S} to M .

Notation 12.1. We denote the set of all sections over U as $\Gamma(U, \mathcal{S})$.

Remark 12.1. Clearly if $\mathcal{S}' \subseteq \mathcal{S}$ is a subsheaf we have,

$$\Gamma(U, \mathcal{S}') \subseteq \Gamma(U, \mathcal{S}).$$

Definition 12.4. Let $(\mathcal{S}, \pi_{\mathcal{S}}), (\mathcal{T}, \pi_{\mathcal{T}})$ be sheaves on X . A morphism $\varphi : \mathcal{S} \rightarrow \mathcal{T}$ of sheaves is a continuous map such that the following diagram commute,

$$\begin{array}{ccc} \mathcal{S} & \xrightarrow{\varphi} & \mathcal{T} \\ \pi_{\mathcal{S}} \searrow & & \swarrow \pi_{\mathcal{T}} \\ & X & \end{array}$$

This induces a map between stalks and for each $x \in X$, we denote,

$$\varphi_x := \varphi|_{\mathcal{S}_x} : \mathcal{S}_x \rightarrow \mathcal{T}_x.$$

Remark 12.2. Given a morphism of sheaves, $\varphi : \mathcal{S} \rightarrow \mathcal{T}$, this induces a map

$$\Gamma(U, \mathcal{S}) \ni s \mapsto \varphi \circ s \in \Gamma(U, \mathcal{T}).$$

We will denote $\varphi|_U(s) = \varphi \circ s$.

Remark 12.3. For any morphism of sheaves $\varphi : \mathcal{S} \rightarrow \mathcal{T}$, $\varphi(\mathcal{S})$ is a subsheaf of \mathcal{T} .

Definition 12.5. A sheaf of abelian group is a sheaf (\mathcal{S}, π) on X such that,

1. For each $x \in X$, $(\mathcal{S}_x, +)$ is an abelian group.
2. For $(\Gamma(U, \mathcal{S}), +)$ is a group with group operation defined pointwise. That is

$$\Gamma(U, \mathcal{S}) \times \Gamma(U, \mathcal{S})(s, t) \mapsto s + t = [U \ni x \mapsto s(x) + t(x)] \in \Gamma(U, \mathcal{S}).$$

Proposition 12.2. Let \mathcal{S} be a sheaf of abelian groups. Then the map,

$$\mathcal{S} \times \mathcal{S} \xrightarrow[\pi]{+} \mathcal{S},$$

is continuous where

$$\mathcal{S} \times \mathcal{S} = \{(f, g) \in \mathcal{S} \times \mathcal{S} \mid \pi(f) = \pi(g)\} \subseteq \mathcal{S} \times \mathcal{S}.$$

Definition 12.6. $\mathcal{S}' \subseteq \mathcal{S}$ is a subsheaf of abelian groups if

- i). it is a subsheaf of sets,
- ii). \mathcal{S}'_x is a subgroup of \mathcal{S}_x for each $x \in X$.

Definition 12.7. Let \mathcal{S}, \mathcal{T} be sheaves of abelian groups. A sheaf homomorphism $\varphi : \mathcal{S} \rightarrow \mathcal{T}$ is such that

- 1. φ is a homomorphism of sheaves of sets,
- 2. $\varphi_x : \mathcal{S}_x \rightarrow \mathcal{T}_x$ is a group homomorphism for each $x \in X$.

Remark 12.4. We have the following trivial statements.

- 1). $\Gamma(U, \mathcal{S})$ is an abelian group for any open subset $U \subseteq X$.
- 2). $\varphi(\mathcal{S}) \subseteq \mathcal{T}$ is a subsheaf of \mathcal{T} .

Definition 12.8. Let $\varphi : \mathcal{S} \rightarrow \mathcal{T}$ be a homomorphism of abelian sheaves. Then we define,

$$\text{Ker } \varphi = \bigsqcup_{x \in X} \{\sigma \in \mathcal{S}_x \mid \varphi_x \sigma = 0 \in \mathcal{T}_x\}.$$

Proposition 12.3. $\text{Ker } \varphi$ is a subsheaf of \mathcal{S} .

Proof. Let $s : U \rightarrow \mathcal{S}$ be a section such that $s(x) \in \text{Ker } \varphi$ for some $x \in X$. Then \square

Remark 12.5. For a sheaf of abelian group \mathcal{S} , the zero subsheaf is a subsheaf $\underline{0}$ such that

$$\underline{0} = \bigsqcup_{x \in X} \{0_{\mathcal{S}_x}\}.$$

This is initial and final.

Lemma 12.1. For an open set $U \subseteq X$, $\varphi|_U : \Gamma(U, \mathcal{S}) \rightarrow \Gamma(U, \mathcal{T})$ is a group homomorphism.

Definition 12.9. A sheaf of commutative ring is a sheaf of abelian group \mathcal{R} such that

- i). For all $x \in X$, \mathcal{R}_x is a commutative ring.
- ii). Multiplication is continuous that is for any open set $U \subseteq X$,

$$\Gamma(U, \mathcal{R}) \times \Gamma(U, \mathcal{R}) \ni (s, t) \mapsto st = [U \ni x \mapsto s(x)t(x)]$$

is a continuous map.

- iii). There is a unit section $x \mapsto 1_x \in \mathcal{R}_x$.

Remark 12.6. $\Gamma(U, \mathcal{R})$ is a commutative ring for all $U \subset X$ open.

Definition 12.10. Let R be a commutative ring and X be a topological space. We define a constant sheaf \underline{R} of R over X to be

$$X \times R \xrightarrow{\pi} X,$$

where R is equipped with the discrete topology, $X \times R$ is equipped with product topology, and π is a canonical projection.

Remark 12.7. If $U \subseteq X$ is connected then $\Gamma(U, \underline{R}) = R$.

Example 12.1. The following are example of sheaves of rings.

1). \mathcal{O} a sheaf of germs of holomorphic functions. This is a Hausdorff space which can be proven using the identity theorem.

2). For $k \in \mathbb{N}$, $\mathcal{C}^k(\mathbb{C}^n)$ is a sheaf of ring. Furthermore, we have a descending chain,

$$\mathcal{C}^0(\mathbb{C}^n) \supseteq \cdots \supseteq \mathcal{C}^\infty(\mathbb{C}^n) \supseteq \mathcal{O}.$$

3). The sheaf of meromorphic function \mathcal{K} .

4). \mathcal{O}^* is the subsheaf of \mathcal{O} consisting of nowhere 0 holomorphic functions and \mathcal{O}_x^* forms an abelian group under multiplication.

5). \mathcal{K}^* is defined similarly.

Definition 12.11. Let \mathcal{R} be a sheaf of commutative rings. We define a sheaf of \mathcal{R} -modules \mathcal{A} to be such that

i). it is a sheaf of abelian groups,

ii). \mathcal{A}_x is an \mathcal{R}_x -module for each $x \in X$,

iii). for each open $U \subseteq X$, $\Gamma(U, \mathcal{R}) \times \Gamma(U, \mathcal{A}) \ni (r, a) \mapsto ra = [U \ni x \mapsto r(x)a(x)]$ is an element of $\Gamma(U, \mathcal{A})$ ie, defines a section over U .

Definition 12.12. A presheaf F of sets is a contravariant functor on the category of open sets of X with values in the category of sets. That is for two open sets $V \subseteq U \subseteq X$, recall that the inclusion relation is represented by an inclusion map $\iota : V \rightarrow U$. Since F is contravariant, this induces a morphism of set,

$$\rho_{UV} := F(V \hookrightarrow U),$$

which we call a restriction map.

Definition 12.13. A homomorphism of presheaves is a functorial morphism (ie. a natural transformation between two contravariant functors.) That is a collection of map $(\varphi_U)_U : \mathcal{S} \rightarrow \mathcal{T}$ such that the following diagram commutes for all $V \subseteq U$ open,

$$\begin{array}{ccc}
\mathcal{S}(U) & \xrightarrow{\varphi_U} & \mathcal{T}(U) \\
\rho_{UV}^{\mathcal{S}} \downarrow & & \downarrow \rho_{UV}^{\mathcal{T}} \\
\mathcal{S}(V) & \xrightarrow{\varphi_V} & \mathcal{T}(V)
\end{array}$$

Definition 12.14. Let $\mathcal{S} \xrightarrow{\pi} X$ be a sheaf. The canonical presheaf associated \mathcal{S} is a functor $X \supseteq U \mapsto \Gamma(U, \mathcal{S})$.

Definition 12.15. A presheaf \mathcal{S} is a sheaf if it is isomorphic to canonical presheaf of a sheaf.

Example 12.2. Set $\mathcal{K}_x = \text{Frac}(\mathcal{O}_x)$ for each $x \in \mathbb{C}^n$ that is \mathcal{K}_x is the germ of meromorphic functions. We define a presheaf $\mathcal{K}^{\text{pre}} := \bigsqcup_{x \in \mathbb{C}^n} \mathcal{K}_x \rightarrow \mathbb{C}^n$. The topology on \mathcal{K}^{pre} is defined by the following way. Take an open subset $U \subseteq \mathbb{C}^n$ and sections $f, g \in \Gamma(U, \mathcal{O})$ such that g is nowhere vanishing on U . Then the topology is generated by base element of the form $\left\{ \frac{f_x}{g_x} \mid x \in U \right\}$. This does not define a sheaf.
